LETTER OF TRANSMITTAL

*To His Excellency, THE HONORABLE EARL WARREN,
Governor of the State of California.*

SIR: I have the honor to herewith transmit Bulletin No. 126 of the Division of Mines, of the Department of Natural Resources, being the annual report of the statistics of the mineral production of California.

The remarkable variety, total values, and wide distribution of many of our minerals revealed herein show California's importance as a producer of commercial minerals among the states of the Union.

Respectfully submitted.

WM. H. MOORE,
Director, Department of Natural Resources

INTRODUCTION

It is the endeavor of the staff of the State Division of Mines (formerly State Mining Bureau), in these annual reports of the mineral industries of California, to so compile the statistics of production that they will be of actual use to producers and to those interested in the utilization of the mineral products of our State, while at the same time keeping the individual's data confidential. In addition to the mere figures of output, we have included descriptions of the uses and characteristics of many of the materials, as well as a brief mention of their occurrences.

The compilation of accurate and dependable figures is an extremely difficult undertaking, and the State Mineralogist takes the opportunity of here expressing his appreciation of the cooperation of the producers in making this work possible. A fuller appreciation of the value of early responses to the requests sent out in January will result in earlier completion of the manuscript. Statistics lose much of their value if their publication is unnecessarily delayed.

Some of the data relative to properties and uses of many of the minerals herein described are repeated from preceding reports, as it is intended that this annual statistical bulletin shall be somewhat of a compendium of information on California's commercial minerals and their utilization.

WALTER W. BRADLEY,
State Mineralogist.

MINERAL INDUSTRY, CALIFORNIA, 1942

DATA COMPILED FROM DIRECT RETURNS FROM PRODUCERS IN ANSWER TO INQUIRIES SENT OUT BY THE CALIFORNIA STATE DIVISION OF MINES, FERRY BUILDING, SAN FRANCISCO, CALIFORNIA

CHAPTER ONE

The total value of the mineral output for California for the year 1942 was \$408,738,434, being an increase of \$34,412,206 over the total of 1941 which was \$374,326,228. The increase was due to stimulated output owing to war demand. There were sixty different mineral substances, exclusive of a segregation of various stones grouped under gems; all fifty-eight counties of the State contributing to the list.

As revealed by the following, the salient features of 1942 as compared with the previous year were: such groups of mineral substances as fuels, structural materials, salines and industrial materials showed increased total values; the metals being the only group to show a decreased value. Of the year's mineral output petroleum showed the greatest increase in value followed in turn by miscellaneous stone, cement, natural gas, chromite, tungsten ore, potash, quicksilver, soda, salt, molybdenum ore, manganese ore, dolomite, iodine, borates, etc. Decreases were registered by gold, silver, mineral water, diatomite, etc. The greatest annual value for their output in California was recorded by bromine, carbon dioxide, cement, dolomite, iodine, iron ore, lithium salts, molybdenum ore, natural gas, quicksilver, silica (quartz and glass sand), soapstone and talc, soda, miscellaneous stone, and tungsten ore.

Of the fuels, petroleum showed an increase in value of \$23,643,376 and an increase in amount from 229,664,784 barrels to 247,491,289 barrels of crude oil. The amount of natural gas utilized increased from 378,173,737 M cubic feet, worth \$21,522,445, to 413,180,942 M cubic feet, valued at \$25,698,052 and was the largest annual consumption on record.

Of the metals, a record total value was recorded for the annual output of iron ore, molybdenum ore, quicksilver, and tungsten ore; while chromite and manganese ore recorded the greatest since 1918; and lead since 1923. Nevertheless, these increased productions did not offset the decrease in the gold and silver production, and the group as a whole showed a decline in total value from \$61,595,912 in 1941 to \$46,185,885 in 1942.

Of the structural materials, cement increased from 19,531,608 barrels, worth \$26,248,694, to 23,306,578 barrels, valued at \$35,808,841; and miscellaneous stone, total value increased from \$19,559,883 to \$27,281,342. Both the above registered the largest annual production so far recorded in California. Brick and hollow building-tile increased in total value from \$3,508,797 to \$5,708,967 entirely due to the increased demand for fire brick. Building stones, such as granite, marble, and sandstone, registered a decline in total value, as also did magnesite.

Of the industrial materials, the group as a whole increased in total value from \$8,502,571 to \$8,606,428, with such items as carbon dioxide, dolomite, lithia, silica (glass sand and quartz), sillimanite group, and soapstone and talc registering increased total values, and barites, bentonite, pottery clay, diatomite, gypsum, pumice and volcanic ash declining in value. The total value of the saline group increased from \$11,927,533 to \$15,645,003, with increases registered by borates, bromine, calcium chloride, iodine, potash, salt, and soda; and magnesium salts the only substance in this classification to show a decline in output.

By Substances

The following table shows the comparative yield of mineral substances of California for 1941 and 1942, as compiled from the returns received at the State Division of Mines, San Francisco, in answer to inquiry sent to producers:

Substance	1941		1942		Increase+ Decrease— Value
	Amount	Value	Amount	Value	
Antimony.....	19,153 lbs.	\$2,537	*	*	* +
Asbestos.....	*	*	8,319 lbs.	\$836	* +
Bentonite.....	18,369 tons	164,582	7,453 tons	67,503	97,079-
Borates.....	224,986 tons	4,745,872	203,716 tons	4,929,553	182,575+
Brick and hollow building tile.....		3,598,797		5,708,967	2,110,170+
Carbon Dioxide.....	138,862 M cu ft.	258,563	193,143 M cu ft.	310,000	51,437+

Quicksilver.....	25,612 flasks	4,509,041	*	*	* +
Salt.....	434,237 tons	1,180,929	672,324 tons	1,922,991	742,062+
Sandstone.....		13,143		8,587	4,556-
Silica (quartz and glass sand).....	137,660 tons	514,266	193,174 tons	692,762	178,496+
Silver.....	2,154,188 fine ozs.	1,531,867	1,450,440 fine ozs.	1,031,424	500,443-
Soapstone and talc.....	47,935 tons	525,396	47,782 tons	545,509	20,113+
Soda.....	179,210 tons	2,028,718	267,723 tons	3,125,078	1,096,360+
Stone, miscellaneous ^b		19,559,883		27,281,342	7,721,459+
Sulphur.....	9,495 tons	209,296	*	*	* +
Tungsten ore.....	171,672 units	4,080,628		*	* +
Zinc.....	880,612 lbs.	66,046	1,275,795 lbs.	118,659	52,613+
Unapportioned.....		7,641,119		22,835,994	15,194,875+
Total value.....		\$374,326,228		408,738,434	
Net increase.....					\$34,412,206

* Included under 'Unapportioned'

^a Includes onyx and travertine

^b Includes macadam, crushed rock, ballast, rubble, riprap, sand and gravel

^c Includes asbestos, barite, bituminous rock, bromine, calcium chloride, calcium silicate, coal, diatomite, feldspar, iodine, iron ore, lithia, magnesite, mica, mineral paint, molybdenum, potash, pyrite, sillimanite group, slate, strontium, titanium, zircon, paving block, tube-mill pebbles

^d Includes antimony, baryte, bituminous rock, bromine, calcium chloride, chromite, coal, diatomite, feldspar, iodine, lithium salts, magnesite, manganese ore, marble, mineral paint, molybdenum ore, paving blocks, platinum metals, potash pyrite, quicksilver, sillimanite group, slate, strontium, sulphur, titanium, tube mill pebbles, tungsten ore

^e In 1942 the limestone used to make lime was included with 'Industrial' limestone

By Counties

The following table shows the comparative value of the mineral production of the various counties in the State for the years 1941 and 1942:

County	1941	1942
Alameda.....	\$4,447,145	\$6,112,794
Alpine.....	6,996	3,097
Amador.....	3,724,412	2,092,030
Butte.....	3,171,872	2,400,858
Calaveras.....	4,394,039	2,998,235
Colusa.....	41,859	41,710

Total Mineral Production of California, by Years, Since 1887

The following tabulation gives the total value of mineral production of California by years since 1887, in which year compilation of such data by the State Mining Bureau (now Division of Mines) began. At the side of these figures have been placed the values of the most important metal and nonmetal items—gold and petroleum.

In the same period copper made an important growth beginning with 1897 following the entry of the Shasta County mines, and later Plumas County. Cement increased rapidly from 1902, while crushed

rock, sand and gravel as a group paralleled the cement increase. Quick-silver has been up and down. Mineral water and salt have always been important items, but the values fluctuate. Borax has increased materially since 1896. War-time increases, 1915-1918, were shown by chromite, copper, lead, magnesite, manganese, silver, tungsten and zinc. Most of these later declined, though silver, structural materials and copper increased in 1920-1924. Natural gas showed a steady increase from 1907, and in 1928-1933 its value was second only to petroleum. In 1939-1942 increases in output similar to those of 1915-1918 were shown by many mineral substances.

In 1929 the annual output of gold was the smallest since its discovery. From 1929 to 1940 there was a rapid increase in gold production, due in part to the raise in its price per ounce.

Total Mineral Production of California, by Years, Since 1887

Year	Total value of all minerals	Gold, value	Petroleum, value
1887.....	\$19,785,868	\$13,588,614	\$1,357,144
1888.....	19,469,320	12,750,000	1,380,666
1889.....	16,681,731	11,212,913	368,048
1890.....	18,039,666	12,309,793	384,200
1891.....	18,872,413	12,728,869	401,264
1892.....	18,300,168	12,571,900	561,333
1893.....	18,811,261	12,422,811	608,092
1894.....	20,203,294	13,923,281	1,064,521
1895.....	22,844,663	15,334,317	1,000,235
1896.....	24,291,398	17,181,562	1,180,793
1897.....	25,142,441	15,871,401	1,918,269

CHAPTER TWO

FUELS

Among the most important mineral products of California are its fuels. This subdivision includes coal, natural gas, and petroleum, the combined values of which make up practically 66 per cent of the State's entire mineral output for the year 1942.

There are deposits of peat known in several localities in California, small amounts of which are used as a fertilizer, and in stockfood preparations, but none has yet been recorded as utilized for fuel.

Comparison of values during 1941 and 1942 is shown in the following table:

Substance	1941		1942		Increase+ Decrease— Value
	Amount	Value	Amount	Value	
Coal*					
Natural gas	378,173,737 M. cu.ft.	\$21,522,445	413,180,942 M cu.ft.	\$25,698,502	\$4,175,607+
Petroleum	229,664,784 bbls.	218,838,171	247,491,289 bbls.	242,481,545	23,643,374+
Total values		\$240,360,616		\$268,179,597	
Net increase					\$27,818,981

* Concealed under 'Unapportioned.'

COAL

Bibliography: State Mineralogist Reports VII, XII-XV (inc.), XVII, XIX-XXVIII (inc.), XXVI, XXXI, XXXV, XXXVII, U. S. Geol. Surv., Bulletins 285, 316, 421, 431, 471, 581; Ann. Rept. 22, Pp. III.

The coal produced in California during 1942 is concealed under the 'Unapportioned' item so as not to reveal the output of a single producer in Amador County. The 1941 production came from one property each in Mendocino and Trinity counties. The 1941-1942 total production amounted to 190 net tons valued at \$1,046 f.o.b. mine. This coal was consumed by the local market and also used on the property for camp purposes, power and forge, to carry on regular operations and development work.

Total Coal Production of California

The very considerable output of coal in the years previous to 1883 was almost entirely from the Mount Diablo district, Contra Costa County. Later the Tesla mine in Corral Hollow, Alameda County, was an important producer for a few years. Stone Canyon, Monterey County, was also an important producer for a short time, and there has been some coal shipped from properties in Amador, Fresno, Orange, Riverside, Siskiyou and Trinity counties. The following tabulation gives the annual tonnages and values, according to available records:

Coal Output and Value, by Years

Year	Tons	Value	Year	Tons	Value
1861	6,620	\$38,065	1903	93,026	\$265,383
1862	23,400	134,550	1904	79,062	376,494
1863	43,200	248,400	1905	46,500	144,500
1864	50,700	291,525	1906	24,850	61,600
1865	60,530	348,048	1907	23,734	55,849
1866	84,020	483,115	1908	18,496	55,503
1867	124,690	716,968	1909	49,389	216,913
1868	143,676	826,137	1910	11,033	23,484
1869	157,234	904,096	1911	11,047	18,297

1893	72,603	167,555	1935	8,049	32,745
1894	59,887	139,862	1936	370	1,815
1895	79,858	193,790	1937	269	2,933
1896	70,649	161,335	1938	275	1,650
1897	87,449	196,255	1939		
1898	143,045	337,475	1940	1,750	8,100
1899	160,941	420,109	1941		
1900	176,956	535,531	1942	190	1,046
1901	150,724	401,772			
1902	88,460	248,622	Totals	5,269,790	\$23,397,785

The tonnages in the above table for the years 1861-1866 (incl.) are taken from the U. S. Geological Survey, "Mineral Resources of the U. S., 1910," p. 107. The values assigned for the years previous to 1883 are those given by W. A. Goodyear (Mineral Res., 1882, pp. 93-94), being an average of \$5.75 per ton. From 1887 to date the figures are those of the California State Mining Bureau.

* Annual details concealed under 'Unapportioned.'

NATURAL GAS

Bibliography: State Mineralogist Reports VII, X, XII, XIII, XIV, XXIX, XXXVII. Bulletins 3, 16, 19, 69, 73, 89, 118. Summary Oil and Gas Supervisor, Dec., 1919; Aug., 1922; Mar., 1923; Mar. and Apr., 1926.

Statistics on the production of natural gas in California are in a considerable degree difficult to arrive at, as much of it that is utilized directly at the wells for heating, lighting, and driving gas engines is not measured. Hence, it is necessary to approximate the output of many of the operators in the oil fields, estimated on the number of lights, and on the number and horsepower of gas engines and steam boilers thus operated. The figures here given are for gas utilized locally and also that sold for distribution to consumers; and we consider are not over-estimated, particularly in the seven oil-producing counties. It must be remembered that some of our important oil fields are removed many miles from the site of any other industry, and that the gathering of small amounts of gas and transporting it for any considerable distance may

not always be profitable, nor is it often possible to have pipe-line facilities available to handle the gas accompanying the early gas production in newly developed fields. Wherever feasible, casing-head gas is used in driving gas engines for pumping and drilling, and in firing the boilers of steam-driven plants.

Production and Value

There is a rather wide variation in prices quoted for natural gas because a considerable part is used directly in the field for driving gas engines and firing boilers, and is therefore not measured nor sold. Such companies as have placed a valuation on the gas that was thus used in 1942 gave from 1.7¢ to 25¢ per 1000 cu. ft. at the well. From the totals shown in the tabulation following herein, the average value for all fields in 1942 works out at approximately 6.22¢ per M cu. ft. Approximately 7000 cu. ft. of gas is equal to one barrel of oil in heating value, and is so accounted for by many operators. In driving gas engines, about 4000 cu. ft. per 24 hr. are consumed by a 25-h.p. engine, and 63,700 cu. ft. per day for heating a 70-h.p. steam boiler, which figures have been utilized in compiling this report, in those cases where gas was not metered.

Utilized Production of Natural Gas in California, 1942

County	M cubic feet	Value
Fresno.....	59,828,203	\$2,946,323
Kern.....	70,890,547	3,431,558
Kings.....	37,266,063	1,821,000
Los Angeles.....	91,719,975	6,186,796
Orange.....	19,347,357	1,293,338
Sacramento.....	49,172,104	3,937,671
San Joaquin.....	11,892,675	839,502
Santa Barbara.....	2,663,010	224,275
Solano.....	29,691,001	2,622,523
Ventura.....	37,911,597	2,180,252
Butte, Humboldt, Lake, Mendocino, Sonoma, Stanislaus, Sutter, Tulare, and Yolo.....	2,861,410	214,814
Totals.....	413,180,942	\$25,698,052

* Combined to conceal output of individual operators in each.

The above figures of 413,180,942 M cubic feet of natural gas utilized and valued at \$25,698,052 are an increase in both amount and value for 1942 output over that of 1941, which was 378,173,737 M cubic feet worth \$21,522,445. As for several years past, Los Angeles County led all others in the yield of natural gas utilized during 1942, followed in turn by Kern, Fresno, Sacramento, Ventura counties.

The gas utilized coming from Kings, Orange, Sacramento, San Joaquin, Solano registered an increase in amount and value over the previous year; while that from Fresno, Kern, Los Angeles, Santa Barbara, and Ventura show a decrease.

Natural Gas Production in California Since 1888

The production of natural gas in California by years since 1888 is given in the following table. The first economic use of natural gas in California was from the famous courthouse well at Stockton, bored in 1854-1858. Beginning about 1883 and for several succeeding years, a number of gas wells were brought in around Stockton, and later at

Sacramento. Natural gas was known in a number of other localities, and occasionally utilized in a small way, notably at Kelseyville in Lake County, and in Humboldt County near Petrolia and Eureka, but there are no available authentic records of amounts or values previous to the year 1888. The most important developments in the commercial production of natural gas have been coincident with developments in the oil fields, by utilizing the casing-head gas as well as that from dry-gas wells.

Natural Gas Production in California Since 1888

Year	M cubic feet	Value	Year	M cubic feet	Value
1888	*12,000	\$10,000	1916	28,134,365	\$2,871,751
1889	*14,500	12,680	1917	44,343,020	2,964,922

^a Quantity, in part, estimated, where values only were reported.

^b Tabulations published previously to 1933 included values of CO₂, now shown under "Industrial Materials."

Gasoline from Natural Gas

More or less gas usually accompanies the petroleum in the old fields, and such gas carries varying amounts of gasoline. A total of 87 plants were in operation in 1942 recovering gasoline by compression or absorption from this 'casing-head' gas. After the gasoline is extracted the remaining 'dry gas' so far as practicable is taken into pipe lines, by which it is distributed to consumers, both domestic and commercial.

During the year 1942 a total of 415,624,450 gallons of natural gas gasoline valued at \$22,374,692 was reported from all fields by 87 plants as compared with 534,962,919 gallons worth \$24,228,808 from 88 plants in 1941. In 1942 a total of 79,421,748 gallons of liquefied petroleum gas was shipped in California, as compared with 68,930,472 gallons for the previous year. The 1942 output was distributed by counties as follows:

Natural Gas Gasoline for 1942

County	Gallons	Value	Liquefied natural gas gallons
Fresno.....	41,401,269	\$1,737,511	34,065,756
Kings.....	32,873,718	1,408,213	
Kern.....	69,737,745	2,641,747	19,994,041
Los Angeles.....	156,273,042	11,598,193	9,044,049
Orange.....	46,452,262	2,048,105	4,854,484
Santa Barbara.....	7,941,197	338,847	1,413,988
Ventura.....	60,945,217	2,602,076	10,049,430
Totals.....	415,624,450	\$22,374,692	79,421,748

The usual recoveries of gasoline from natural gas vary from $\frac{1}{2}$ gal. to 3 gal. per 1000 cu. ft. of gas handled, the average being about 1 gal. per 1000 cu. ft. The U. S. Bureau of Mines Report by Knudsen¹ gives the average recovery for 1942 as 1.585 gallons per 1000 cu. ft. of gas treated. His figures show the following production by methods:

	M cubic feet natural gas treated	Gallons of gasoline recovered	Recovery gallons per M cubic feet
Oil absorption.....	344,122,011	545,465,776	1.585

PETROLEUM

Bibliography: State Mineralogist Reports IV, VII, X, XII, XIII, XXIX, XXXI, XXXIII-XXXV, XXXVII. Bulletins 3, 11, 16, 19, 31, 32, 63, 69, 73, 82, 84, 89, 118. Reports of Oil and Gas Supervisor 1915 to date (issued in monthly chapters since April, 1919, to June, 1929, and quarterly from then on). U. S. Geol. Surv. Bulletins 213, 285, 309, 317, 321, 322, 340, 357, 398, 406, 431, 471, 541, 581, 603, 621, 623, 653, 691. Prof. Papers 116, 117. "American Petroleum; Supply and Demand"; Amer. Petr. Inst., 1925.

The crude petroleum produced in California during 1942 amounted to a total of 247,491,289 barrels having a value of \$242,481,545 at the well. This was an increase in both amount and value compared with the 1941 output, which was 229,664,784 barrels worth \$218,838,171.

This total of quantity is compiled from the monthly production reports filed by the operators with the State Oil and Gas Supervisor.

The question of the value of the crude oil yield at the well is a difficult one to settle with exactitude principally because a large part of the output is not sold until after refining. The large refiners are also large producers of crude oil which they send direct from well to plant, hence much of the crude oil is not sold as such.

The value used in the statistical reports of the State Mining Bureau and the Division of Mines from 1914 to 1927 (inc.) was derived from an average of actual sales of crude oil of all grades in each field of the State and their average applied to the total yield of each respective field. The 1929-1933 values, used by the Division of Mines, were

¹ Knudsen, E. T., The Petroleum Situation in the Pacific Coast Territory (Monthly for 1942), U. S. Bureau of Mines.

obtained by using the production of crude oil by gravities produced in each field and applying an average of current price quotations for crude oil at the well as compiled by California Oil and Gas Association.

The values given to the 1934-1942 petroleum output by this department were obtained by using the average gravity oil for each field, to which was applied the average quotation for the year of said grade oil.

TABLE A
Production and Value of Crude Oil by Counties

County	1941		1942	
	Barrels	Value	Barrels	Value
Fresno.....	20,302,492	\$19,560,723	23,959,303	\$21,206,580
Kern.....	65,628,935	57,607,724	72,093,741	64,477,255

State averages...	\$0.831	\$0.913	\$0.970	\$0.986	\$0.997	\$1.038	\$1.009	\$0.929	\$0.953	\$0.980

For several years previous to 1919, the State average value per barrel at the well for crude oil as determined by the statistical returns was noted to practically coincide with the quotations during the same years for 23° gravity oil in the San Joaquin Valley fields. In 1919 and since, the average values have worked out at figures corresponding to quotations up to, in one year as high as 28° oil, due to the large yield of high-gravity oils from the new fields in the Los Angeles-Orange counties area.

TOTAL PETROLEUM PRODUCTION OF CALIFORNIA

The presence of oil seepages and springs in Los Angeles and Ventura counties was known and utilized in a small way early in the history of California. Some also was shipped to refineries at San Francisco from Santa Barbara and Humboldt counties. In the light of present-day developments, the following reference to the previous year's production of oil and its future prospects as expressed by the San Francisco Bulletin of January 8, 1866, is strikingly prophetic even though skeptical:

"It is possible that the small quantity received (40,000 or 50,000 gallons in 1865) may be the forerunner of many millions which will, at some future time, lubricate the wheels of commerce and set a trade at work excelling in variety any that has thus far been known on this coast. At present, however, we admit to being a little skeptical about the assumption of the astute Professor Silliman that California will be found to have more oil in its soil than all the whales in the Pacific Ocean."

According to Hanks,¹ in 1874 production amounted to 36 bbl. per day from natural flows in Pico Cañon (Newhall), and at Sulphur Mountain (Ventura County), the oil being of 32° gravity average.

"Work was commenced in Pico Canyon in 1875 by drilling three shallow wells with spring pole, all of which yielded oil at depths of from 90 to 250 feet. Actual work of development commenced with steam machinery in 1877."²

In 1877 Pico averaged 40-50 bbl. daily, and Ventura 80 bbl. daily. In 1878, there was some production (at 60 bbl. per day, for a time) from wells in Moody Gulch, near Los Gatos, Santa Clara County, the oil being of 46° Baumé.

The first wells in the Coalinga, Fresno County, and Summerland, Santa Barbara County, fields were drilled in 1890, but Coalinga did not make its influence felt conspicuously on the state's annual output until 1903. The Summerland yield never has been large. The Salt Lake field near Los Angeles began production in 1894 and in 1897 reached over a million barrels annually.

In the Kern County fields, the first well was drilled in Sunset in 1891, Midway in 1900, McKittrick in 1892, Kern River in 1899. The Sunset-Midway district attained a yield of over 4,000,000 bbl. in 1909, and over 20,000,000 bbl. in 1910. Kern River field produced over 3,000,000 bbl. in 1901.

The first well in the Santa Maria-Lompoc group, Santa Barbara County, was drilled in 1901, and the district advanced to a yield of over 3,000,000 bbl. annually in 1905.

The Whittier-Fullerton field in Los Angeles and Orange counties became an important factor in 1902. The Montebello field, Los Angeles County, was the conspicuous addition in 1918-1919; and Elk Hills, Kern County, with Huntington Beach and Richfield, Orange County, in 1920. In 1921, the new fields added were Long Beach and Santa Fe Springs, Los Angeles County; in 1922, Torrance field in Los Angeles County, and Wheeler Ridge field in Kern County; but the production from the large number of new wells started in these new Los Angeles County fields did not reach its peak until August and September, 1923. Dominguez (Compton) came in during 1923; followed by Rosecrans and Inglewood in 1924. Ventura recorded important additions to its

¹ Hanks, Henry G., Report IV of State Mineralogist, p. 298, 1884.

² *Idem.* p. 301.

producing area in 1925 and 1926. Seal Beach, Orange County, and Mt. Poso, Kern County, were the new fields added in 1926; Round Mountain, Kern County, and Rincon, Ventura County, were the new fields added in 1927; with Potrero in Los Angeles County, Elwood in Santa Barbara County and Kettleman Hills in Kings County in 1928.

During 1929 Playa del Rey was added to the oil fields in Los Angeles County, and more recently a number of others have been added in Fresno, Los Angeles, Kern, and Santa Barbara.

The effect of the advent of these various fields to the producing column will be noted in the tabulation herewith, by years:

Specific Gravity of Oils Produced

The proportion of heavy and light oil produced in the various fields is shown in Table E, following, for which we are indebted to the Standard Oil Company. Specific gravities in California range from 8° Baumé in the Casmalia field, Santa Barbara County, to 60° in Kettleman Hills, Kings County.

California crude oils are all essentially of asphalt base, with a few notable exceptions. In the following localities are wells yielding crudes containing both asphalt and paraffine constituents: Oil City field, Coalinga; a few deep wells in East Side field, Coalinga; a considerable part of the Ventura County field; Western Minerals area, south of Maricopa; Wheeler Ridge, Kern County.

Oil in "Storage"

Field, refinery, pipe-line and tank-farm stocks of crude and refined products in the Pacific Coast ¹ territory totaled 125,465,486 barrels on December 31, 1942, as compared with 137,683,332 barrels on December 31, 1941, with a total decrease in stock from the preceding year of 12,217,846 barrels. Table F gives a breakdown of stocks as of December 31, 1941 compared with December 31, 1942.

¹ American Petroleum Institute: Summary of California Oilfield Operations for December, 1942.

Utilization of California Crude Oil

Most of the crude oil produced in California is sent to storage reservoirs at tank farms near the oil fields and from these reservoirs by pipe lines to the refineries, the larger ones of which are located in the vicinity of Los Angeles and on San Francisco Bay.

During 1942 the crude oil consumed in California according to the U. S. Bureau of Mines¹ was 219,248,000 barrels sent to stills at the refinery; 10,916,000 barrels used for cracking; 16,895,000 barrels either consumed as fuel or added to residuum; and there were no shipments of crude out of the State as such; also stocks were depleted by 2,135,000 barrels compared with 1941 when 207,204,000 barrels were sent to the stills; 5,929,000 barrels were used for cracking; 10,858,000 barrels either used as fuel or added to residuum; and stocks were depleted by 1,831,000 barrels from the previous year.

The production of petroleum products during 1941 and 1942 is shown in Table G:

TABLE G

Commodity	1941 Amount in barrels	1942 Amount in barrels
Crude petroleum to stills	207,204,000	219,248,000
Crude used for cracking	5,929,000	10,916,000
Natural gas gasoline	13,810,000	12,989,000
Gasoline and naphtha distillates	86,392,000	86,476,000
Kerosene	2,695,000	2,778,000
Lubricating oil and greases	3,978,000	2,905,000
Gas oil and diesel oil	31,721,000	31,733,000
Residuum and non-gasoline-bearing crude (fuel oil) ^a	83,150,000	95,980,000
Asphalt and road oil	8,371,000	11,915,000
Totals ^b	221,014,000	243,153,000
^a Includes heavy non-gasoline crude oil	10,858,000	16,895,000
^b Totals of crude oil and natural gasoline.		

Operating Data

The following tabulation (Table H) is compiled from data published by the State Division of Oil and Gas,² semiannually, and here combined to show the entire year's operations for all fields. The districts are the geographical subdivisions as administered by that Division and which are outlined on the accompanying map.

It will be noted that the state average yield of oil per-well-per-day was 61.4 barrels for the first six months of 1942 and 71.6 barrels for the second. This is somewhat higher than the figures 36.7 barrels average for December derived from American Petroleum Institute data as shown in Table D, on a previous page, due in part at least, to the fact that the latter is on a full-time basis, whereas the Division's figures allow for shut-down time.

Proved Oil Land

The total proved oil land and natural gas land in California as of December 31, 1942 was 211,805 acres; an increase of 12,560 acres during the year 1942, according to data furnished by the Division of Oil and Gas.¹ The acreage as of December 31, 1941 and December 31, 1942, by counties, is given in the following Table I:

CHAPTER THREE

METALS

Bibliography: Reports of State Mineralogist I-XXXIX (inc.). Bulletins 5, 6, 18, 23, 27, 36, 50, 57, 76, 78, 85, 92, 95, 108. Spurr and Wormser, "Marketing of Metals and Minerals." See also under each metal.

The value of the metals produced in California during 1942 amounted to \$46,185,885, as compared with \$61,595,912 in 1941. Chief among these as to value is, and always has been gold, followed in turn by tungsten ore, quicksilver, chromite, silver, lead, molybdenum ore, manganese ore, etc.

A comparison of the 1941 output with that of 1942 is afforded by the following table:

Substance	1941		1942		Increase+ Decrease— Value
	Amount	Value	Amount	Value	
Copper.....	8,101,449 lbs.	\$955,670	2,138,149 lbs.	\$258,716	\$697,254—
Gold.....	1,408,793 fine ozs.	49,307,755	847,997 fine ozs.	29,679,895	19,627,860—
Iron ore.....			99,092 tons	371,562	— +
Lead.....	6,900,851 lbs.	393,348	10,329,176 lbs.	692,054	298,706+—
Silver.....	2,154,188 fine ozs.	1,531,867	1,450,440 fine ozs.	1,031,424	500,443—
Zinc.....	880,612 lbs.	66,046	1,275,795 lbs.	118,659	52,613+—
Unapportioned.....	^a	9,340,928	^b	14,033,575	4,692,649+—
Total values.....		\$61,595,912		\$46,185,885	
Net increase.....					\$15,410,027

^a Includes antimony, chromite, iron ore, manganese ore, molybdenum ore, platinum group metals, quicksilver, titanium ore, and tungsten ore.

^b Includes antimony, chromite, manganese ore, molybdenum ore, platinum group metals, quicksilver, titanium ore, and tungsten ore.

ALUMINUM

Bibliography: Report XVIII, p. 198, XXXVII. Bulletins 38, 67. U. S. Geol. Surv., Min. Res. of U. S.

To date there has been no commercial production of aluminum ore in California. Only a single authenticated occurrence of bauxite has thus far been noted in this state, being in Riverside County southeast of Corona, but as yet undeveloped.

Minerals containing aluminum are abundant, the most widely distributed being the clays. There are only two, however, thus far of consequence commercially, in the production of the metal; bauxite (to which may be added the related hydrated oxides, hydrargillite and diaspore) and cryolite. Cryolite is found in commercial quantities only in south Greenland, and was formerly the only ore of aluminum used, being still employed as a flux in the extraction of the metal. Bauxite has been for some years the most important source of aluminum and its salts. Its color varies from gray to red, according to the amount of iron present, the composition ranging usually between the following limits: Al_2O_3 , 30%–60%; Fe_2O_3 , 3%–25%; SiO_2 , 0.5%–20%; TiO_2 , 0.0–10%. Besides its reduction to the metal bauxite is also utilized in the manufacture of aluminum salts, refractories, alundum (fused alumina) for use as an abrasive, and in the refining of oil.

ANTIMONY

Bibliography: State Mineralogist Reports VIII, X, XII-XV (inc.), XVII, XXII, XXIII, XXV-XXVII (inc.), XXXI, XXXIV, XXXVI. Bulletins 38, 91.

During 1941 and 1942 there were shipments of antimony ore in California from properties in Inyo, Kern, San Benito, and San Bernardino counties. The annual details are concealed under the 'Unapportioned' item as provided for in the regulations of the Office of War Information, but will be made available at some later date. The 1942 output was the largest since 1917.

Pure antimony metal and manufactured antimony compounds are of considerable importance as pigments in the ceramic industry. The most important use of the metal, commercially, is in various alloys, particularly type-metal (with tin and lead), babbitt (with tin and copper), and britannia metal (with tin and copper). An alloy of 6% antimony and 94% lead is being extensively used in making battery plates for storage batteries for automobiles, airplanes and radio apparatus.

Present New York quotations (Sept. 23, 1943) are around 16.5¢ per pound for Chinese (duty paid) and 15.839¢ for domestic antimony.

Antimony Production in California, by Years

The production of antimony ore in California by years since 1887 has been as follows:

Year	Tons	Value	Year	Tons	Value
1887.....	75	\$15,500	1916.....	1,015	\$64,793
1888.....	100	20,000	1917.....	158	18,786
1889.....			1918.....		
1893.....	50	2,250	1925 [*]	*26	77½
1894.....	150	6,000	1926 [*]	20	59½

* Annual details concealed under 'Unapportioned.'

* Beginning 1940, amount of recoverable metal; before, tons of antimony ore shipped.

ARSENIC

Bibliography: Reports XVIII, XXIII, XXV, XXX, XXXIII, XXXV. Bulletin 67. U. S. G. S., Min. Res. of U. S.

Arsenic is found in a number of localities in California in the mineral arsenopyrite (FeAsS), which is frequently gold bearing; and in scorodite ($\text{FeAsO}_4 + 2\text{H}_2\text{O}$), an oxidation product of arsenopyrite. The occurrence of realgar (AsS) has also been noted.

Except for a small output in 1924, there has been no commercial recovery of arsenic from California ores. There having been only a single operator, the figures are concealed under the 'Unapportioned' item.

BERYLLIUM

Bibliography: State Mineralogist Report XXVII, XXXV, XXXVI. Eng. & Min. Jour.-Press, Vol. 118, No. 8, p. 285, Aug. 23, 1924. U. S. Bureau of Mines Information Circular 6190.

Beryllium is a metal resembling aluminum closely in its chemical character. It has a specific gravity of 1.85, is almost as hard as quartz (will scratch glass) and will take a high polish. The use of beryllium as a metal is still more or less in the experimental stage because the cost of extracting the metal from its ores almost makes it prohibitive and the present sources of supply of the ore are limited. Not until such a time when deposits can be found that will assure a definite supply and metallurgical costs are such as to justify its use, will the metal be found in common use.

There are a number of beryllium minerals, but none have been found in commercial quantities, except beryl, which is a beryllium-aluminum silicate. The chief use at present for ground beryl is as an addition to porcelain products, where it reduces the coefficient of expansion. Beryllium metal is difficult to separate from aluminum.

Present (Sept. 23, 1943) quotations for beryllium ore are per ton in carload lots, 10 to 12 percent BeO \$100 to \$120, f.o.b. mine.

Beryl occurs in California in the pegmatite dikes of the tourmaline gem district in northern San Diego and northwestern Riverside counties; and an occurrence has recently been noted in western Inyo County, but the quantity is as yet unproved. Thus far there have been no commercial shipments of beryl from California except for gem purposes (the pink and aquamarine varieties).

BISMUTH

Bibliography: State Mineralogist Report XXXV. Bulletins 38, 67, 91. Am. Jour. Sci., 1903, Vol. 16.

During 1942, several hundred pounds of bismuth concentrates were made at a tungsten mine in Fresno county, but no shipments were made during the year.

Several bismuth minerals have been found in California, notably native bismuth and bismite (the ochre) in the tourmaline gem district in San Diego and Riverside counties near Pala. Other occurrences of bismuth minerals, including the sulphide, bismuthinite, have been noted in Inyo, Fresno, Nevada, Tuolumne, San Bernardino, and Mono counties, but only in small quantities. The only commercial production recorded was 20 tons valued at \$2,400 in 1904, and credited to Riverside County.

The uses of bismuth are somewhat restricted, being employed principally in the preparation of medicinal salts, and in low melting-point or cliché alloys. These alloys are utilized in automatic fire sprinkler systems, in electric fuses, and in solders.

The present quotation (Sept. 23, 1943) for bismuth is \$1.25 per pound, in ton lots for the refined metal.

CADMIUM

Bibliography: U. S. Geol. Surv., Min. Res. of U. S., 1908, 1918.

During 1917 and 1918, cadmium metal was recovered by the electrolytic zinc plant of the Mammoth Copper Company in Shasta County. It was shipped in the form of 'sticks' and amounted to a total of several thousand pounds for the two years, the exact figures being concealed under 'Unapportioned.' That was the first, and thus far the only, commercial production of cadmium recorded from California ore. Cadmium occurs there associated with zinc sulphide, sphalerite. Cadmium also occurs in the Cerro Gordo Mines, Inyo County, associated with smithsonite (zinc carbonate).

Cadmium is produced in the United States in two forms—metallic cadmium and the pigment, cadmium sulphide. The principal use of the metal is in low-melting point, or cliché alloys, and its salts are utilized in the arts, medicine, and in electroplating. The sulphide is employed as a paint pigment, being a strong yellow, which is unaffected by hydrogen sulphide gas from coal smoke. It is also employed in coloring glass and porcelain. Cadmium cliché metal is stated to be superior to the corresponding bismuth alloy, for making stereotype plates. Cadmium is also used in bronze telegraph and telephone wires, and gives some promise of being utilized in electroplating.

The present quotation (June 11, 1942) for cadmium is 90¢ per pound for the metal.

CHROMITE

Bibliography: State Mineralogist Reports IV, XII, XIII, XIV, XV, XVII, XVIII, XXI-XXIX (inc.), XXXI, XXXIV-XXXIX (inc.). Bulletins 38, 76, 91. Preliminary Report 3. U. S. G. S., Bull. 430. Min. & Sci. Press, Vol. 114, p. 552.

During 1942 shipments of chromite or chrome-iron ore in California were made from properties in Butte, Calaveras, Del Norte, El Dorado, Fresno, Glenn, Humboldt, Mendocino, Placer, Plumas, San Luis Obispo, Shasta, Siskiyou, Tehama, Trinity, and Tuolumne counties. The annual details are concealed under the 'Unapportioned' item as provided for in regulations of the Office of War Information, but will be released at some later date.

Occurrence

Chromite is widely distributed in California, the principal production, thus far, having come from El Dorado, San Luis Obispo, Del Norte, Shasta, Siskiyou, Placer, Fresno, and Tuolumne counties. In 1918 a total of 29 counties contributed to the State's output. There are two main belts in California yielding this mineral, one along the Coast Ranges from San Luis Obispo County to the Oregon line, including the Klamath Mountains at the north end, and the other in the Sierra Nevada from Tulare County to Plumas County. Chromite occurs as lenses in basic igneous rocks such as periodite and pyroxenite, and in serpentines which have been derived by alteration of such basic rocks.

Uses

The major consumption of chromite ore is for use as a refractory lining in smelting furnaces for steel and copper. A smaller portion is used in the preparation of ferrochrome for chrome-steel alloys, and of chromium chemicals, the latest development of which is chrome plating as used in the automobile industry, on ships, and in oil refineries to protect metal surfaces from wear and erosion.

Mill of Castro Chrome Associates at Goldtree Siding near San Luis Obispo, San Luis Obispo County. Photo by Walter W. Bradley

Total Chromite Production of California

Production of chromite in California began, apparently in the period 1869-1873 in Del Norte County, followed by San Luis Obispo in 1874. There was considerable activity in San Luis Obispo from 1880 to 1883, inclusive, and a total of 23,238 long tons (or 26,028 short tons) valued at \$329,924 was shipped from that county up to the beginning of 1887. There are records of shipments from Sonoma County (before 1883), Placer County (1883 and 1884), and Calaveras County. Apparently the state's total in the period 1869-1883 was some 45,000 tons.¹ The tabulation herewith shows the output of chromite in California annually, including the earliest figures so far as they are available. The figures from 1887 to date are from the records of the State Mining Bureau:

¹ Day, D. T., Mineral Res. of the U. S. 1883-1884, U. S. G. S., pp. 569, 570, 1885.

a Included under 'Unapportioned.'

COBALT

Bibliography: Report XIV, XXXIII, XXXIV, XXXVII. Bulletins 67, 91. U. S. G. S., Min. Res. of U. S., 1912, 1918. U. S. B. M., I.C. 6331.

Occurrences of some of the cobalt minerals have been noted in several localities in California, but to date no commercial production has resulted. Some of the copper ores of the foothill copper belt in Mariposa and Madera counties have been found to contain cobalt up to 3%.

The nominal quotation for cobalt (September 23, 1943) is around 97 to 99% at \$2.11 per pound for the refined metal.

The most important use of cobalt is in the manufacture of the alloy, stellite, in which it is combined with chromium, for making high-speed lathe tools, and non-tarnishing cutlery and surgeons' appliances. The metal is also used in electroplating, similarly to nickel; and the oxide, carbonate, chloride, sulphate and other salts are used in ceramics for coloring. Some of the organic salts of cobalt (acetate, resinate, oleate) are employed as 'driers' in paint and varnish.

COPPER

Bibliography: State Mineralogist Reports VIII-XXXIX (inc.).
Bulletins 23, 50, 91.

The total output of copper in California during 1942 amounted to 2,138,149 pounds of recoverable metal valued at \$258,716. This was a decrease in both amount and value as compared with the 1941 figures, which were 8,101,449 pounds worth \$955,970. The average price of copper during 1942 was 12.1¢ per pound compared with 11.8¢ per pound in 1941; 11.3¢ per pound in 1940; 10.4¢ per pound in 1939; 9.8¢ in 1938; 12.1¢ in 1937; 9.2¢ in 1936; 8.3¢ in 1935; and 8.0¢ in 1934.

Distribution of the 1942 output of copper in California by counties was as follows:

County	Pounds	Value
Amador	1,854	\$224
Calaveras	531,618	64,326
Humboldt	6,409	775
Inyo	753,556	91,180
Kern	2,172	263
Madera	64,988	7,864
Mariposa	26,973	3,264
Nevada	13,299	1,609
Placer	7,600	920
San Bernardino	157,195	19,021
Siskiyou	7,668	928
Tuolumne	4,555	551
Alameda, Butte, El Dorado, Imperial, Los Angeles, Mono, Orange, Plumas, Riverside, Santa Barbara, Shasta, Trinity*	560,262	67,791
Totals	2,138,149	\$258,716

* Combined to conceal the output of individual producers in each.

Copper Production of California, by Years

Although some mining of copper ores in a small way had been done earlier, shipments in appreciable quantities began in 1861 and continued of importance up to the end of 1867, when a total of 68,631 tons (of 2376 pounds) of high-grade ores, and 847 tons of matte or 'regulus'² had been shipped to smelters at New York, Boston, and Swansea, Wales. The most important district at that time was Copperopolis and vicinity in Calaveras County, with some shipments also made from Mariposa, El Dorado, Fresno and San Luis Obispo counties. From 1868 to 1882, the output was insignificant. There are wide discrepancies in the figures recorded for copper production previous to 1882, in which year the data of the U. S. Geological Survey began. The detailed statistics of the California State Mining Bureau began in the year 1894.

² Browne, J. Ross, Mineral Resources West of the Rocky Mountains, p. 168, 1867.

Amount and value of copper production in California annually since 1882 is given in the following tabulation:

Copper Production of California, by Years

Year	Pounds	Value	Year	Pounds	Value
1882	826,695	\$144,672	1913	34,471,118	\$5,343,023
1883	1,600,862	265,743	1914	30,491,535	4,055,375

GOLD

Bibliography: State Mineralogist Reports I to XXXIX (inc.), (except III and VIII). Bulletins 36, 45, 57, 91, 92, 95, 108. U. S. Geol. Surv., Prof. Paper 73. U. S. Bur. of Mines, Econ. Paper 3 (1929).

Gold was first, and, for many years, the most important single mineral product of California. Although now surpassed for a number of years in annual value by petroleum, and by natural gas from 1923 to 1932, it still heads our metal list, and California continues to outrank all the other gold-producing States of the United States, including Alaska. In fact, at present, California is producing approximately 25% of the gold mined in the entire United States.

There was a steady increase in the output of both lode and placer mines in California from 1928 to 1942, but in 1941 the value of placer production continued to increase, although that of lode dropped off 8 percent and in 1942 a sharp decline in the yield of both lode and placer mines, first by the increased difficulty of obtaining supplies and labor and on October 8, 1942, the War Production Board's Order L-208, closing down most of the gold and silver mines in the State. During 1942 there were 434 operating lode mines and 428 placer properties, but these did not include snipers, prospectors, and various individuals selling gold in small lots to the bullion dealers.

The production of gold during 1942 totaled 847,997 fine ounces valued at \$29,679,895 being a decrease of 560,796 fine ounces from the

1941 yield, which was 1,408,793 fine ounces worth \$49,307,755. Deep or lode mines accounted for 383,071 fine ounces worth \$13,407,485 of the 1942 gold output; and placers (mainly bucket-line, drag-line, and power shovel dredges) produced 464,926 fine ounces worth \$16,272,410.

The 1940 output was the largest in value since 1856 and in amount since 1862. The 1939 lode output of gold was undoubtedly the largest in the history of the State.

As the Division of Mines has never independently gathered the statistics of gold and silver production, these figures, as in former years, are published by cooperation with and through the courtesy of Charles White Merrill and H. M. Gaylord of the Division of Mineral Statistics, U. S. Bureau of Mines.

The largest production by counties was reported by Nevada County with an output of 161,593 fine ounces (\$5,655,755); followed by Sacramento County with 125,120 fine ounces (\$4,379,200); Yuba County with 75,595 fine ounces (\$2,645,825); Butte County with 60,916 fine ounces (\$2,132,060); followed in turn by Kern, Amador, Siskiyou, and Mariposa counties, all with a total gold yield having a value in excess of a million dollars.

The gold from Nevada, Kern, Amador, and Mariposa counties is mainly from the lode or deep mines; while that from Butte, Sacramento, Siskiyou, and Yuba counties is almost entirely from dredges.

Distribution for the 1942 gold output by counties was as follows:

Counties	Mines producing ¹		Totals	
	Lode	Placer	Fine ounces	Value
Alpine.....	2	-----	17	\$595
Amador.....	14	25	49,474	1,731,590

¹ Excludes itinerant prospectors, snipers, high graders, and others who gave no evidence of legal right to property.

² Output from property not classed as a "mine."

³ Combined to avoid disclosure of individual output.

The following is quoted from the advance statement of gold in 1942 by courtesy of the U. S. Bureau of Mines,* Department of Commerce:

"Gold—An uninterrupted rise beginning in 1929 culminated in the production of \$50,948,485, in gold in 1940, the largest value since 1856. In 1941, however, a reaction set in and gained headway in 1942. Monthly production declined approximately 4 percent a month fairly regularly from January 1941 to May 1942, when the downward trend greatly accelerated and continued at about 16 percent a month to December 1942. Strangely, the period when War Production Board Order L-208 was becoming effective did not mark a substantial change in the trend. Apparently, economic forces were curtailing gold production so rapidly in 1942 that exercise of Federal authority was not needed to accomplish a most drastic curtailment in gold mining in California. Production in December was at an annual rate of 246,612 fine ounces or \$8,631,420, which, except for 1929 (when California gold output was valued at \$8,526,703), represented the lowest level since 1848.

"The 25 leading gold-producing mines in California in 1942 listed in the following table, yielded 60 percent of the total gold output of the State. In 1942, six placers (five connected-bucket dredges and one dragline dredge) and two lode mines (gold ore) displaced two placers (connected-bucket dredges) and six lodes (five gold ore and one copper ore). Of those displaced, none was working at the end of 1942. Of those on the 1942 list, only four were producing at the close of the year."

Twenty-five Leading Gold-producing Mines in California in 1942, in Order of Output

Rank	Mine	District	County	Rank in 1941	Operator	Source of gold
1	Natomas Co.....	Folsom.....	Sacramento	2	Natomas Co.....	Dredge

¹ Corrected figure.

Total Gold Production of California.

The presence of gold in stream gravels near Los Angeles was known and worked in a small way by the Indians, at least as early as 1841,¹ and possibly 1820.² On March 2, 1844, Don Manuel Castanares, deputy for California to the Congress of Mexico, reported³ to his government that placers near Los Angeles had produced up to December, 1843, a total of 2000 ounces of gold dust, most of which had been sent to the United States Mint at Philadelphia.

³ Mercantile Trust Review of the Pacific, Vol. XIV, No. 2, p. 43, Feb. 15, 1925.

As the padres and the rancheros discouraged the quest of gold, this early, small production caused no particular excitement. It was not until James W. Marshall's finding of gold nuggets in the tail-race of Sutter's saw mill on the American River, January 24, 1848, was heralded abroad that the great rush began, and California became a commonwealth of first rank almost over night. There are, however, no authentic data on gold production prior to 1848, other than occasional, scattered references such as above quoted.

The following table was originally compiled by Chas. G. Yale, of the Division of Mineral Resources, U. S. Geological Survey, but for a number of years statistician of the California State Mining Bureau and the U. S. Mint at San Francisco. The authorities chosen for certain periods were: J. D. Whitney, State Geologist of California; John Arthur Phillips, author of "Mining and Metallurgy of Gold and Silver" (1867); U. S. Mining Commissioner R. W. Raymond; U. S. Mining Commissioner J. Ross Browne; Wm. P. Blake, Commissioner from California to the Paris Exposition, where he made a report on "Precious Metals" (1867); John J. Valentine, author for many years of the annual report on precious metals published by Wells, Fargo & Company's Express; and Louis A. Garnett, in the early days manager of the San Francisco refinery, where records of gold receipts and shipments were kept. Mr. Yale obtained other data from the reports of the director of the U. S. Mint and the director of the U. S. Geological Survey. The authorities referred to who were alive at the time of the original compilation of this table in 1894 were all consulted in person or by letter by Mr. Yale with reference to the correctness of their published data, and the final table quoted was then made up.

There was no premium paid on gold during 1932, the price being \$20.67 a fine ounce. On August 29, 1933, there was an executive order lifting the embargo on gold ores, concentrates, precipitates, and unretorted amalgam, followed on October 25, 1933, by another order instructing the Reconstruction Finance Corporation to buy newly-mined gold at a price fixed by the U. S. Treasurer which corresponded to the world price, all of which had an effect on the 1933 gold yield. On January 30, 1934, the Gold Reserve Act of 1934 was passed, followed by the President's proclamation of January 31, 1934, which fixed the weight of the gold dollar at 15 5/21 grains, nine-tenths fine. The value of gold thereby became \$35 a fine ounce. The average weighted value of gold per fine ounce in 1934 was \$34.95.

The figures for 1903-1923 (inclusive) are those prepared by the U. S. Geological Survey; and since by the U. S. Bureau of Mines:

Total Gold Production of California, 1848 to 1942

Year	Fine ounces	Value	Year	Fine ounces	Value
1848.....	11,866	\$245,301	1897.....	767,779	\$15,871,401

1896.....	831,158	17,181,562			

a Value calculated at an average weighted price of \$25.56 per fine ounce; previously \$20.6718.

b Value calculated at an average weighted price of \$34.95 per fine ounce.

c Value \$35 per fine ounce, beginning 1935.

IRIDIUM (see under Platinum)

IRON ORE

Bibliography: State Mineralogist Reports II, IV, V, X, XII-XV (inc.), XVII, XVIII, XXI-XXVII (incl.), XXX, XXXI, XXXIII-XXXVI (inc.), XXXIX. Bulletins 38, 67, 91. Am. Inst. Min. Eng., Trans. LIII. Min. & Sci. Press, Vol. 115, pp. 112, 117-122; Vol. 123, pp. 94-96, 113-114.

During 1942 there were shipments of iron ore in California coming from three properties in San Bernardino County; and from one property each in Inyo, Shasta, and Trinity counties to the total amount of 99,092 tons, valued at \$371,562. This was the largest annual output as to both amount and value ever reported in this State.

The material mined during the year was hematite from San Bernardino County and magnetite from Inyo, Shasta, and Trinity counties. The hematite was used for steel and in the manufacture of high-iron cement, with the magnetite for heavy concrete used as ballast.

There are considerable deposits of iron ore known in California, notably in Shasta, Madera, Placer, Plumas, Riverside, San Bernardino, and Los Angeles counties, but production has so far been limited for lack of an economic supply of coking coal. Some pig iron has been made, utilizing charcoal for fuel, both in blast furnaces and by electrical reduction; also, ferrochrome, ferromanganese, and ferrosilicon have been made in California.

Iron Ore Production in California, by Years

Total iron ore production of California, with annual amounts and values, is as follows:

Year	Tons	Value	Year	Tons	Value
1881*	9,273	\$79,452	1920	5,975	\$40,889
1882	2,073	17,766	1921	1,970	12,030
1883	11,191	106,540	1922	3,588	18,868
1884	4,532	40,983	1923	3,102	18,665
1885			1924		
1886	3,676	19,250	1925/ ^a	785	4,710
1887			1926		
1893	250	2,000	1927/ ^a	5,272	26,000
1894	200	1,500	1928		
1895			1930		
1907	400	400	1931/ ^a	100	700
1908			1932		
1909	108	174	1934		
1910	579	900	1935/ ^a	38,339	163,714
1911	558	558	1936	31,084	155,434
1912	2,508	2,508	1937	5,490	29,340
1913	2,343	4,485	1938	27,878	141,406
1914	1,436	5,128	1939	16,990	77,788
1915	724	2,584	1940/ ^a	54,707	194,362
1916	3,000	6,000	1941/ ^a	99,092	371,562
1917	2,874	11,496	1942		
1918	3,108	15,947			
1919	2,300	13,796	Totals	345,385	\$1,686,635

* Productions for the years 1881-1886 (inc.) were reported as "tons of pig iron" (U.S.G.S., Min. Res. 1885), and for the table herewith are calculated to "tons of ore" on the basis of 47.6% Fe as shown by an average of analyses of the ores (State Mineralogist Report IV, p. 242). This early production of pig iron was from the blast furnaces then in operation at Hotelling in Placer County. Charcoal was used in lieu of coke. Though producing a superior grade of metal, they were obliged finally to close down, as they could not compete with the cheaper English and eastern United States iron brought in by sea to San Francisco.

LEAD

Bibliography: State Mineralogist Reports IV, VIII-XV (inc.), XVII-XXVIII (inc.), XXX, XXXI, XXXIII-XXXVI (inc.), XXXIX.

The output of lead in California during 1942 amounted to a total of 10,329,176 pounds of metal valued at \$692,054, compared with 6,900,851 pounds worth \$393,348 in 1941. The average of lead in 1942 was 6.7¢ per pound compared with 5.7¢ per pound in 1941; 5.0¢ per pound in 1940; 4.7¢ per pound in 1939; 4.6¢ per pound in 1938; 5.9¢ per pound in 1937; and 4.6¢ per pound in 1936.

Distribution of the 1942 output of lead by counties was as follows:

County	Pounds	Value
Amador.....	10,559	\$708
Inyo.....	10,170,864	681,448
Kern.....	17,616	1,180
Mariposa.....	15,782	1,057
Nevada.....	14,562	976
Orange.....	9,286	622
Placer.....	23,559	1,579
San Bernardino.....	59,498	3,986
Butte, Calaveras, El Dorado, Imperial, Los Angeles, Mono, Plumas, Shasta, Siskiyou, Trinity*	7,451	498
Totals.....	10,329,176	\$692,054

* Combined to conceal the output of individual operators in each.

Lead Production of the United States

According to preliminary data issued by the U. S. Bureau of Mines¹ during 1942, the production of primary lead in the United States was 492,435 short tons valued at \$65,986,290, being an increase over the national production of 1941, which was 461,426 short tons worth \$52,-602,564.

Lead Production of California, by Years

Statistics on lead production in California were first compiled by this Bureau in 1887. Amount and value of the output, annually, with total figures, to date, are given in the following table:

Lead Production of California, by Years

Year	Pounds	Value	Year	Pounds	Value
1877.....	a7,836,000	\$391,800	1911.....	1,403,839	\$63,173

MANGANESE

Bibliography: State Mineralogist Reports XII-XV (inc.), XVIII, XXII-XXVII (inc.), XXIX-XXXI, XXXIII-XXXIX (inc.). Bulletins 38, 67, 76, 91. U. S. G. S. Bull. 427. Eng. & Min. Jour.-Press, Vol. 117, p. 545.

Manganese ore shipped in California during 1942 came from properties in Alameda, Amador, Imperial, Humboldt, Lake, Marin, Mariposa, Mendocino, Nevada, Mono, Plumas, Riverside, San Bernardino, San Joaquin, San Luis Obispo, Santa Clara, Sonoma, Stanislaus, Trinity, and Tulare counties. The annual details are concealed under 'Unapportioned' item as provided for in regulations of the Office of War Information, but will be revealed at some later date.

Manganese Ore Production in California, by Years

Production of manganese ore in California began at the Ladd Mine, San Joaquin County, in the Telsa District in 1867. When shipments of this ore to England ceased late in 1874, upwards of 5000 tons had been produced by that property. For some years following that, the output was small. The tabulation herewith shows California's output of manganese ore, annually, since 1887, when the compilation of such figures was begun by the State Mining Bureau:

Year	Tons	Value	Year	Tons	Value
1887	1,000	\$9,000	1914	150	\$1,500
1888	1,500	13,500	1915	4,013	49,068
1889	53	901	1916	13,404	274,601
1890	386	3,178	1917	15,515	396,659
1891	705	3,830	1918	26,075	979,235
1892	300	3,000	1919	11,569	451,422
1893	270	4,050	1920	2,892	62,323
1894	523	5,512	1921	1,005	12,210
1895	880	8,200	1922	540	7,650
1896	518	3,415	1923	690	10,620
1897	504	4,080	1924	1,115	25,785
1898	440	2,102	1925	832	19,450
1899	295	3,165	1926	235	4,700
1900	131	1,310	1927

MOLYBDENUM

Bibliography: State Mineralogist Reports XIV, XVII-XXIV (inc.), XXVI-XXVIII (inc.), XXX, XXXIV-XXXVI (inc.). Bulletins 67, 91. U. S. Bur. of Min., Bulletin 111. Proc. Colo. Sci. Soc., Vol. XI.

Molybdenum is used as an alloy constituent in the steel industry, and in certain forms of electrical apparatus. Included in the latter is its successful substitution for platinum and platinum-iridium in electric contact-making and -breaking devices. In alloys it is used similarly to and in conjunction with chromium, cobalt, iron, manganese, nickel, tungsten and vanadium. The oxides and the ammonium salt have important chemical uses.

The two principal molybdenum minerals are: the sulphide, molybdenite, and wulfenite, lead molybdate; the former furnishing practically the entire commercial output. Molybdenite is found in or associated with acidic igneous rocks, such as granite and pegmatite.

Deposits of disseminated molybdenite are known in several localities in California, and in at least two places it occurs in small masses associated with copper sulphides. The first recorded commercial shipments of molybdenum ore in California were during the war, 1916-1918. Some development work has been done on a high-grade deposit at the head of the Kaweah River, Tulare County.

During 1941 and 1942 there were shipments of molybdenum concentrates in California coming from a tungsten mine in Inyo County. The annual details are concealed under the 'Unapportioned' item so as not to reveal the output of an individual producer. The 1940 output was the largest annual yield exceeding the total of all previous production.

The growing consumption of molybdenum by alloy-steel makers in the United States has been stimulated by the fact that molybdenum alone

of the steel-alloying metals can be produced commercially in the United States to an extent which avoids all necessity for importation. Another fact has been the marked adaptability of molybdenum steels to large-scale production of automobile and other parts.

The present (Sept. 23, 1943) quotations on molybdenum ores are 45¢ per pound of MoS_2 contained, f.o.b. mine, and on ferromolybdenum are 95¢ per pound Mo, 55%-65% Mo f.o.b. shipping point.

Molybdenum Production of California, by Years

California's production of molybdenum ore by years is summarized in the following tabulation:

Year	Pounds of MoS_2	Value
1916-----	9,280	\$9,945
1917-----	7,290	9,014
1918-----	-----	-----
1919-----	270	300
1933 } -----	-----	-----
1934 } a -----	1,306	306
1939 } -----	-----	-----
1940 } a -----	383,233	147,126
1941 } -----	-----	-----
1942 } -----	a	a
Totals-----	401,379	\$166,691

a Annual details concealed under 'Unapportioned.'

NICKEL

Bibliography: State Mineralogist Reports XIV, XVII, XXIV, XXV, XXVIII, XXX, XXXIV-XXXVI, (inc.) XXXIX. U. S. G. S., Bulletin 640-D. U. S. Bureau of Standards, Circular 100.

Nickel occurs in the Friday Copper Mine in the Julian District, San Diego County. The ore is a nickel-bearing pyrrhotite, with some associated chalcopyrite. Some ore has been mined in the course of development work but not treated nor disposed of, as they were unable to get any smelter to handle it for them. Nickel ore has also been reported from other localities in California, but not yet confirmed.

Present (June 11, 1942) quotations for nickel are around 35¢ per pound for the refined metal.

OSMIUM (see under Platinum)

PALLADIUM (see under Platinum)

PLATINUM GROUP METALS

Bibliography: State Mineralogist Reports IV, VIII, IX, XII-XXVI (inc.) XXVIII, XXX, XXXI, XXXIV-XXXVII (inc.). Bulletins 38, 45, 67, 85, 91, 92. U. S. Geol. Surv., Bulletins 193, 285. Trans. Am. Inst. Min. Eng., Vol. 47, pp. 217-218.

In California the platinum-group metals are obtained as a by-product from placer operations for gold. The major portion of it comes from the dredges working in Amador, Butte, Merced, Sacramento, Stanislaus, Shasta, Trinity and Yuba counties, with a small amount coming from the hydraulic and surface sluicing mines of Del Norte, Humboldt, Siskiyou and Trinity counties.

The platinum group metals shipped in California during 1942 came from properties in Amador, Butte, El Dorado, Merced, Sacramento, San

Joaquin, Siskiyou, Stanislaus, Trinity, and Yuba counties. Annual details are concealed under the 'Unapportioned' item as provided for in regulations of the Office of War Information, but will be released at some later date.

Present quotations ¹ (September 23, 1943) are, platinum \$35 a fine ounce; iridium \$165 per fine ounce; osmium per fine ounce, \$50; palladium per fine ounce, \$24; ruthenium per fine ounce \$35; rhodium per fine ounce, \$125.

Platinum Production of California, by Years

QUICKSILVER

Bibliography: State Mineralogist Reports IV, V, XII-XV, XVII-XXIX (inc.), XXXI, XXXIII-XXXVII (inc.). Bulletins 27, 78, 91. U. S. Geol. Surv., Monograph XIII. U. S. Bur. of Mines, Tech. Papers 96, 227; Bulletin 222, 335.

Quicksilver was produced in California during 1942 from properties in Colusa, Contra Costa, Fresno, Inyo, Kings, Lake, Mendocino, Monterey, Napa, San Benito, San Luis Obispo, Santa Barbara, Santa Clara, Sonoma, Stanislaus, Trinity, and Yolo counties. The annual details are concealed under the 'Unapportioned' item as provided for in regulations of the Office of War Information, but will be released at some later date.

During the year 1942 the average New York quotation ¹ was \$196.430 per 76-pound flask, while the average price received by the California miner was \$184.575 per 76-pound flask.

The value of the 1942 output was the greatest in the past 92 years in which a record has been kept of quicksilver production in California.

¹ Engineering and Mining Journal, 1942, Vol. 143.

Total Quicksilver Production of California

Total amount and value of the quicksilver production of California, as given in available records, are shown in the following tabulation. Though the New Almaden Mine in Santa Clara County was first worked in 1824, and was in practically continuous operation from 1846 to 1921 (the yield being small the first two years), there are no available data on the output earlier than 1850. Previous to June, 1904, a 'flask' of quicksilver contained $76\frac{1}{2}$ pounds; then 75 pounds up to and including 1927; beginning with 1928, 76 pounds. In compiling this table the following sources of information were used: for 1850-1883, table by J. B. Randol, in Report of State Mineralogist IV, p. 336; 1883-1893, U. S. Geological Survey reports; 1894 to date, statistical bulletins of the State Mining Bureau; also State Mining Bureau, Bulletin 27, "Quicksilver Resources of California," 1908, p. 10.

SILVER

Bibliography: State Mineralogist Reports IV, VIII, XII-XXXIX (inc.). Bulletins 67, 91, 108. Min. & Sci. Press, March 1, 1919.

The 1942 output of silver in California totaled 1,450,440 fine ounces valued at \$1,031,424, being a decrease in both value and amount as compared with the 1941 production of 2,154,188 fine ounces worth \$1,531,867. Of the 1942 yield 40,635 fine ounces worth \$28,896 came from the placers. The average price paid for new mined domestic silver in 1942 was 71.11¢ per fine ounce compared with 71.11¢ in 1941; 71.11¢ in 1940; 67.80¢ in 1939; 64.60¢ in 1938; 77.35¢ in 1937; 77.45¢ in 1936; and 71.875¢ in 1935.

Silver production by counties for 1942 was as follows:

County	Fine ounces	Value
Alpine	3	\$2
Amador	11,091	7,887
Butte	20,350	14,471
Calaveras	8,380	5,959
Del Norte	3	2
El Dorado	2,284	1,624
Fresno	201	143
Humboldt	637	453

The following paragraph is quoted from the U. S. Bureau of Mines,¹ chapter on Gold and Silver from Mineral Year Book 1942, by courtesy of Charles White Merrill and H. M. Gaylord.

"Silver—Most of the silver output in California in 1942 was more localized than that of the gold; the 10 leading silver producing mines, listed in the following table, yielded 85 percent of the State total recoverable silver in that year. The list is similar to that of 1941, except for some changes in rank and the displacement of the Starlight mine (consolidated with its neighbor), Walker, and Grigsby mines, which suspended operations in 1941. By December, six of the 10 leading silver mines had suspended operations."

Ten Leading Silver-producing Mines in California in 1942, in Order of Output

Rank	Mine	District	County	Rank in 1941	Operator	Source of silver
1	Cactus Queen	Mojave	Kern	1	Cactus Mines Co.	Gold-silver ore
2	Lava Cap	Grass Valley-Nevada City	Nevada	2	Lava Cap Gold Mining Corporation	Gold ore
3	Columbia No. 2	Resting Springs	Inyo	6	Shoshone Mines, Inc.	Lead ore
4	Golden Queen	Mojave	Kern	3	Golden Queen Mining Co.	Gold ore
5	Pine Creek	Bishop Creek	Inyo	19	United States Vanadium Corporation	Tungsten-molybdenum-copper ore
6	Essex-Columbia (Darwin Lead)	Coso	Inyo	16	Imperial Mines, Inc.	Silver ore and lead ore
7	Kelly	Randsburg	San Bernardino	7	Frank W. Royer	Silver ore
8	Empire Star mines	Grass Valley-Nevada City	Nevada	8	Empire Star Mines Co., Ltd.	Gold ore
9	Alabama	Ophir	Placer	9	Alabama California Gold Mines Co.	Gold ore
10	Idaho Maryland-Brunswick	Grass Valley-Nevada City	Nevada	17	Idaho Maryland Mines Corporation	Gold ore

Silver Production of California, by Years

The amount and value of the silver production of California, and the average price, annually, since 1880 are given in the table following. In the table shown in the statistical bulletins previously to Bulletin 97 (for 1925), the values shown for 1880-1904 (inc.) were taken from the reports of the Director of the Mint, of which the figures for 1880-1896 (inc.) were based on 'coinage value' (\$1.2929 per fine ounce). We have recalculated these to commercial value, using the price table of the U. S. Geological Survey (McCaskey, H. D.), Gold and Silver, 1913: Mineral Resources of the U. S., Part I, p. 847. From 1905 to date, the figures are those of the U. S. Geological Survey and its successor, the U. S. Bureau of Mines. Figures for the years prior to 1880 are not available, as there were no reliable records compiled.

Silver Production of California, by Years, Since 1880

Year	Fine oz.	Value	Average price per oz.	Year	Fine oz.	Value	Average price per oz.

TIN

Bibliography: Reports XV, XVII, XVIII, XXV, XXXI, XXXIV, XXXV-XXXVII. Bulletins 67, 91.

During 1940 there was some development at the Apex Mine nine miles north of Cima, San Bernardino County, but no shipments in 1941 or 1942. Here the tin ore occurs in small kidneys along the talcose slip in dolmitic limestone.

In 1928 and 1929 there was a small amount of tin produced from California ore as well as considerable development work which was done at the Temescal mine in Riverside County near Corona. There was an

output from the district during 1891-1892 as tabulated below. Small quantities of stream tin have been found in some of the placer workings in northern California, but never in paying amounts.

Two occurrences have also been noted, in northern San Diego County. Crystals of cassiterite were found there, associated with blue tourmaline crystals, amblygonite and beryl. No commercial quantity has been developed, only small pockets having been taken out.

Total Output of Tin in California

TITANIUM

Bibliography: State Mineralogist's Reports XXIII, XXXIV.

During 1942 there were small shipments of titanium ore (ilmenite) made from material recovered from beach sand at Hermosa Beach, Los Angeles County. The annual details are concealed under the 'Unapportioned' item to conceal the output of an individual producer.

Also during the year the E. I. du Pont de Nemours Company continued to do exploration work on the deposit of ilmenite in the San Gabriel Mountains in Los Angeles County to determine the extent of the deposit. They have also run an experimental test on the ores for commercializing it in the near future.

All titanium ore mined in this State came from Los Angeles County and was produced from either the beach black sands which contained approximately 20% titaniferous iron and magnetite, the gangue being silica and several silicates, or from a lode deposit in the San Gabriel Mountains.

The market price of titanium minerals varies as to the titanium oxide it contains. Present (Sept. 23, 1943) quotations are: Rutile 94% TiO at 8¢ to 10¢ a pound, ilmenite 60% TiO at \$28 to \$30 a gross ton, all prices Atlantic seaboard.

The metal is used in several different alloys with iron, copper and aluminum and for green and white paint pigments, the only colors of titanium pigments now in common use. It is also used in dyes, rubber, as a porcelain glaze, in glass, and cement made from high-titanium iron slags. This cement is resistant to the action of acids.

TUNGSTEN

Bibliography: Reports XV, XVII, XVIII, XXII, XXIV, XXVIII (inc.), XXX, XXXIV-XXXVII (inc.). Bulletins 38, 67, 91, 95, U.S.G.S., Bull. 652. Proc. Colo. Sci. Soc., Vol. XI. South Dakota School of Mines, Bulletin No. 12. Eng. and Min. Jour.-Press, Vol. 113, pp. 666-669, Apr. 22, 1922.

The commercial production of tungsten ores and concentrates in California began in 1905; and has been continuous since, with the exception of 1920-1922, inclusive. During 1942 shipments were made in California of high-grade sorted tungsten ore and concentrates from properties in Fresno, Inyo, Kern, Mono, Riverside, San Bernardino, Tulare, and Tuolumne counties. The annual details are concealed under the 'Unapportioned' item as provided for in regulations of the Office of War Information, but will be released at some later date. The 1942 output was the largest ever made in this State in the amount shipped, with an average value of \$24.16 per unit of WO_3 received by the miner.

Tungsten ores have been produced in California principally in the Atolia-Randsburg district in San Bernardino and Kern counties, and the Bishop district in Inyo County; with smaller amounts having come from near Posey (Jack Ranch), Tulare County; Benton, Mono County; the Kings River district in Fresno County; in eastern San Bernardino County near Goffs and Ivanpah; the Grass Valley district in Nevada County; and recently added to the above is the Darwin district in Inyo County; the Kernville and Weldon districts in Kern County; Topaz Lake district in Mono County; and near Warm Springs, San Diego County. Also there are known occurrences of tungsten ores in Alpine, Calaveras, El Dorado, Mariposa, Madera, Plumas, Riverside, Shasta, and Tuolumne counties, of which several are now in production. It also should be considered that in the last ten years there have been more new tungsten deposits discovered than any other type of mineral deposit in this State. Nearly all the ore mined in California has been scheelite (calcium tungstate), although wolframite (iron-manganese tungstate), hübnerite (manganese tungstate), and other tungsten minerals are found in small amounts, in part associated with the scheelite.

Total Tungsten Ore Production of California

The annual amount and value of tungsten ores and concentrates produced in California since the inception of the industry is given herewith, with tonnages recalculated to 60% WO₃:

Tungsten Production of California by Years

VANADIUM

Bibliography: Reports XV, XXVI. Bulletins 67, 91. Proc. Colo. Sci. Soc., Vol. XI, XXXVI. U. S. Bur. of Mines, Bulletin 104.

No commercial production of vanadium has yet been made in California. Occurrences of this metal have been found at Camp Signal, near Goffs, in San Bernardino County, and two companies at one time did considerable development work in the endeavor to open up paying quantities. Some ore carrying lead vanadate has been developed in the 29 Palms, or Washington district, on the line between Riverside and San Bernardino counties, but no shipments reported.

The principal use of vanadium is as an alloy in steels, especially in tool steel, and in those varieties where resistance to repeated strains is required. Present (September 23, 1943) New York quotations for ferro-vanadium are \$2.75-\$2.90 per pound of vanadium f.o.b. works, and vanadium ore 27½¢ per pound V₂O₅ contained.

ZINC

Bibliography: State Mineralogist Reports XIV, XV, XVII, XVIII, XX-XXIV, XXVI, XXVII, XXX, XXXIII-XXXV (inc.). Bulletins 38, 67, 91.

The recoverable zinc mined in California during 1942 amounted to a total of 1,275,906 pounds valued at \$118,659, and came from properties in Calaveras, Inyo, Orange, and San Bernardino counties. The 1942 output was an increase in both amount and value over that of 1941, which was 880,612 pounds worth \$66,046.

The mine production of recoverable zinc in the United States ¹ during 1942 amounted to 760,210 short tons valued at \$138,358,220, compared with the 1941 output of 749,125 short tons worth \$112,368,750. The average price per pound for zinc in 1942 was 9.1¢; compared with 7.5¢ in 1941; 6.3¢ in 1940; 5.2¢ in 1939; 4.8¢ in 1938; and 6.5¢ in 1937.

The zinc ores in Shasta and Calaveras counties are associated with those of copper, while those of Inyo, Los Angeles, Orange, San Bernardino, and Tulare were associated principally with lead-silver and zinc-silver ores.

Total Zinc Production of California

Total figures for zinc output of the State are as follows, commercial production dating back only to 1906:

Year	Pounds	Value	Year	Pounds	Value
1906.....	206,000	\$12,566	1925.....	11,546,602	\$877,542

CHAPTER FOUR

STRUCTURAL MATERIALS

Bibliography: State Mineralogist Reports XII-XXXVIII (inc.). Bulletin 38. Spurr and Wormser, "Marketing of Metals and Minerals." "Non-Metallic Minerals," by R. B. Ladoo. "Industrial Minerals and Rocks," A. I. M. E., 1937. See also under each substance.

As indicated by this subdivision heading, the mineral substances herein considered are those more or less directly used in building and structural work. California is independent, so far as these are concerned, and almost any reasonable construction can be made with materials produced in the State. Chromite, which previous to 1933 was listed under structural materials in the statistical reports of the State Division of Mines, is now transferred to the metals group, thus coinciding with the practice of the United States Bureau of Mines.

Lime, previous to 1942, which was carried under this group, is now combined with limestone in the industrial group, so as to avoid possible duplication and as most of the lime is used in industry and not in construction. This "structural" branch of the mineral industry for 1942 had a total value of \$70,121,466, compared with \$51,938,605 in 1941. Most material grouped in this classification during 1942 showed increases in amount and value, with cement and miscellaneous stone registering all-time highs. Decreased total values were reported by producers of granite, magnesite, marble, and sandstone.

In 1942 all counties, but two, namely Kings and Sutter, contributed to the structural materials total. There is not a county in the fifty-eight counties of the State which is not capable of producing at least one of the materials under the classification.

The following summary shows the value of the structural materials produced in California during the years 1941-1942, with increases or decreases in each instance:

Substance.	1941		1942		Increase + Decrease— Value
	Amount	Value	Amount	Value	
Brick and hollow building tile.....		\$3,598,797		\$5,708,967	\$2,110,170+
Cement.....	19,531,608 bbls.	26,248,694	23,306,578 bbls.	35,808,841	9,560,147+
Granite.....		261,661		186,871	74,789—
Lime.....	110,719 tons	996,514			
Marble.....		14,448			
Sandstone.....		* 13,143		8,587	4,556—
Stone, miscellaneous.....	34,626,035 tons	19,559,883	45,455,085 tons	27,281,342	7,721,459+
Unapportioned.....		* 1,245,465		1,126,857	118,608—
Total values.....		\$51,938,605		\$70,121,466	
Net increase.....					\$18,182,861

* Included under 'Unapportioned.'

^a Includes bituminous rock, magnesite, slate, paving blocks, and tube mill pebbles.

^b Includes bituminous rock, magnesite, marble, slate, paving blocks, and tube mill pebbles.

ASPHALT

Bibliography: State Mineralogist Reports VII, X, XII-XV (inc.), XVII, XVIII. Bulletins 16, 32, 63, 67, 69, 91, 118.

Asphalt was for a number of years accounted for in the statistical reports by the State Mining Bureau, because in the early days of the

oil industry, considerable asphalt was produced from outcroppings of oil sand, and was a separate industry from the production of oil itself. However, at the present time most of the asphalt comes from the oil refineries, which produce a better and more uniform grade; hence, its value is not now included in the mineral total, as to do so would be in part a duplication of the crude petroleum figures. Such natural asphalt as is at present mined is in the form of bituminous sandstones, and is recorded under that designation.

BITUMINOUS ROCK

Bibliography: State Mineralogist Reports XII, XIII, XV, XVII, XVIII, XXI, XXII, XXV, XXVI, XXXI.

This material is essentially an uncemented sandstone which is saturated with and held together by a natural asphaltic constituent, probably the residue from the evaporation of a crude petroleum deposit. Bituminous rock is still used to a limited extent for road dressing in those districts adjacent to available deposits, though the manufacture of asphalt at the oil refineries has almost entirely superseded the direct use of the native material. Some of the Santa Cruz County production is put on the market as a material which can be laid cold. This material is especially applicable and valuable for patch jobs.

During 1942 the output of bituminous rock in California came from a single property each in Santa Barbara and Santa Cruz counties; the annual details are concealed under the 'Unapportioned' item so as not to reveal the output of either operator. The 1942 production showed an increase in amount and value as compared with that of 1941.

Bituminous Rock Production of California, by Years.

The following tabulation shows the total amount and value of bituminous rock quarried and sold in California, from the records compiled by the State Mining Bureau, annually since 1887:

Year	Tons	Value	Year	Tons	Value
1887.....	36,000	\$160,000	1916.....	19,449	\$66,561

BRICK AND HOLLOW TILE

Bibliography: State Mineralogist Reports VIII, X, XII-XV (inc.), XVII-XXVIII (inc.), XXXII, XXXVII. Bulletins 38, 39. Preliminary Report No. 7. Cal. Jour. of Development, June, 1925, pp. 5-6.

Bricks of many varieties and in important quantities are annually produced in California, as might be expected in a state with such diversified and widespread mineral resources. The varieties include common, fire, pressed, glazed, enamel, fancy, vitrified, sand-lime, and others. Not only do the plants here supply practically all of our own requirements in these products, but considerable quantities are shipped to contiguous territory and certain products are shipped over a much wider radius. We also include under this heading the various forms of hollow building 'tile' or blocks.

During the year 1942 there was produced in California 117,739 M of common brick, valued at \$1,296,449; 55,843 M of fire brick, valued at \$3,655,210; 7,353 M of glazed, pressed, vitrified, and fancy brick, worth \$412,966; and 24,703 tons of hollow building tile, worth \$344,342, the entire output having a total value of \$5,708,967, as compared with the 1941 output which was 103,690 M of common brick, worth \$1,158,590; 27,864 M of fire brick, worth \$2,010,111; 6,371 M of glazed, pressed, fancy, and vitrified brick, worth \$264,708; and 16,513 tons of hollow building tile, worth \$165,388, with a total value of \$3,598,797 for the year. It will be noted that fire brick practically doubled in both amount and value in 1942 over 1941 and that all other brick and building tile showed an increased output during the same period of time.

The 1942 brick and hollow building tile production was manufactured in 33 plants in 16 counties; eleven of which were in Los Angeles County; three in Contra Costa County; two each in Alameda, Sacramento, San Bernardino, San Diego, and San Joaquin counties; and one each in Amador, Fresno, Orange, Placer, Riverside, San Luis Obispo, Santa Barbara, Santa Clara, and Tulare counties.

Brick and Hollow-Tile Production of California, by Years.

Record of brick production in the state has been kept since 1893 by this Bureau, the figures for hollow building 'tile' or blocks being also included since 1914. The annual and total figures, for amount and value, are given in the following table:

Year	Brick, M	Hollow building blocks, tons	Value
1893.....	103,900		\$801,750
1894.....	81,675		457,125
1895.....	131,772		672,360
1896.....	24,000		524,740
1897.....	97,468		563,240
1898.....	100,102		571,362
1899.....	125,950		754,730
1900.....	137,191		905,210

CEMENT

Bibliography: State Mineralogist Reports VIII, IX, XII, XIV, XV, XVII, XVIII, XXI-XXVIII (inc.), XXXII. Bulletin 38.

During 1942 cement produced in California amounted to 23,306,578 barrels, valued at \$35,808,841, f.o.b. plant, of which 12,056,912 barrels came from plants in northern California and 11,249,666 barrels from plants in the southern part of the State. This is the largest annual output in both amount and value ever reported in this State. The 1941 production amounted to 19,531,608 barrels, worth \$26,248,694.

Shipments during 1941 were made by twelve plants in eleven counties to the extent of 23,732,414 barrels, valued at \$36,964,122 f.o.b. plant, as compared with 19,833,796 barrels, worth \$27,219,800 in 1941. During 1942 there were seven operating mills in northern California; one each in Calaveras, Contra Costa, Merced, San Benito, San Mateo, Santa Clara, and Santa Cruz counties, which shipped a total of 12,150,363 barrels of cement; and five mills in southern California; and two in San Bernardino County, and one each in Kern, Los Angeles,¹ and Riverside counties, which shipped a total of 11,582,051 barrels of cement. There was an average of 2,889 men employed in the above mills during the year. The annual capacity of California cement mills, according to the U. S. Bureau of Mines,² was 27,540,000 barrels as of January, 1943, as compared with 26,040,000 barrels for January, 1942.

Cement Production of California, by Years

'Portland' cement was first commercially produced in California in 1891; though in 1860 and for several years following, a natural hydraulic cement from Benicia was utilized in building operations in San Francisco.

"The Benicia Cement Company in 1859-60 was turning out 50 to 100 barrels of cement a day and San Francisco was using about 12,000 barrels a year. The mill price of the product was then \$4 a barrel. By 1865, the San Francisco rate of consumption had increased to 100,000 barrels yearly, brick buildings largely taking the place of frame structures, and the price of cement had fallen to \$2.50 a barrel, about the same as it is today."³

The growth of the industry became rapid after 1902; since which time cement has continued to be an important factor in the industrial life of the State. Although the total cement figures, to date, are not of the same magnitude as those for gold and petroleum, it is interesting to note that the value of California's cement yield in the period 1920-1931 annually exceeded the value of her gold output.

¹ The plant in Los Angeles County grinds clinker coming from other counties, therefore the crude material is credited to the point of origin.

GRANITE

Bibliography: State Mineralogist Reports X, XII-XXVI (inc.), XXVIII, XXXI, XXXV-XXXVII (inc.). Bulletin 38.

The 1942 output of granite in California had a total value of \$186,-872, as compared with \$261,661 for 1941. The 1942 production included 2,885 cu. ft. of building stone valued at \$4,185; 26,703 cu. ft. of monumental stone valued at \$171,403; and 4,867 tons of unclassified material including some tuff, volcanic rock, and a small amount of mica schist, which were used as building stone and flagstone having a value of \$11,284. The above came from two quarries in Placer County; and one quarry each in Fresno, Lassen, Madera, Riverside, Sacramento, San Bernardino, San Diego, Sonoma, and Ventura counties. The stone from Sonoma County was a tuff and that from Ventura County was volcanic rock.

In recent years there has been a steady decline in the production of granite and other building stone, due to the increase of concrete construction, which is steadily replacing stone.

So far as possible, granite production has been segregated in the statement herewith into the various uses to which the product was put. It will be noted, however, that a portion of the output has been entered under the heading 'Unclassified.' This is necessary because of the fact that some of the producers have no way of telling to what specific use their stone was put after they had quarried and sold the same in the rough.

Varieties

For building purposes, the granite found in California, particularly the varieties from Raymond in Madera County, Rocklin in Placer County and near Porterville in Tulare County, are unexcelled by any similar stone found elsewhere. The quantities available, notably at Raymond

and Porterville, are unlimited. Most of California's 'granite,' particularly that found in the Sierra Nevada Mountains, is technically 'granodiorite' (that is, both plagioclase and orthoclase feldspars are present).

Granites of excellent quality for building and ornamental purposes are also quarried in Riverside, San Bernardino, and San Diego counties. Near Lakeside, San Diego County, there is a fine-grained, 'silver gray' granite of uniform texture and color, especially suited for monumental and ornamental work.

The Fresno County stone is a dark, hornblende diorite, locally called 'black granite,' whose color permits of a fine contrast of polished and unpolished surfaces, making it particularly suitable for monumental and decorative purposes. There is also similar 'black granite' in Tulare County, near Success.

Granite Production of California, by Years

The value of granite produced, annually, since 1887 has been as follows:

Year	Value	Year	Value
1887.....	\$150,000	1916.....	\$535,339
1888.....	57,000	1917.....	221,997

LIME

Bibliography: State Mineralogist Reports XIV, XV, XVII-XXIX (inc.), XXXIII-XXXV (inc.), Bulletin 38.

The early output of lime in California was used entirely for structural purposes. Later a small percent was put out for chemical, agricultural, and industrial uses and still later lime replaced limestone in metallurgy. In 1942 the structural use had decreased to such a point and other uses increased to where they required the largest part of the lime burnt in this State, so it was decided to include lime with 'industrial' limestone in this statistical report.

Lime Production of California, by Years

The following tabulation gives the amounts and value of lime produced in California by years since 1894 when compilation of such records was begun by the State Mining Bureau. The figures for quantity have been recalculated from 'barrels,' as shown in the earlier reports, to 'tons' for the years 1894-1922 (inc.):

Year	Tons	Value	Year	Tons	Value
1894.....	37,350	\$318,700	1919.....	42,070	\$552,043
1895.....	39,776	386,094	1920.....	46,314	557,232
1896.....	30,275	261,505	1921.....	46,353	610,619
1897.....	28,780	252,900	1922.....	57,875	671,747
1898.....	29,786	254,010	1923.....	70,894	788,834
1899.....	29,955	314,575	1924.....	62,029	703,355
1900.....	31,252	283,699	1925.....	61,922	685,528
1901.....	31,738	334,688	1926.....	63,568	670,837

MAGNESITE

Bibliography: State Mineralogist Reports XII-XV (inc.), XVII-XXVII (inc.), XXX, XXXI, XXXIV, XXXVI-XXXVII. Bulletins 38, 79, 91. U. S. Geol. Surv., Bulletins 355, 540. Min. Res. 1913, Pt. II, pp. 450-453. Min. & Sci. Press, Vol. 114, p. 237. "Magnesite"—Hearings before Comm. on Ways and Means, House of Repr., on H. R. 5218, June 16, 17, and July 17, 1919. Eng. Soc. W. Penn., Proc. 1913, Vol. 29, pp. 305-388, 418-444. Eng. & Min. Jour.-Press, Vol. 114, July 29, and Dec. 2, 1922. U. S. Tariff Comm., "Crude and Caustic Calcined Magnesite. A Preliminary Statement of Information," May 19, 1926.

During 1942 magnesite was produced in California from a single property each in Alameda, Santa Clara, and Stanislaus counties, and reduced from salt-works bitterns at Newark, Alameda County. The annual details are concealed under the 'Unapportioned' item so as not to reveal the output of a single company. Practically all the above was shipped in the calcined form.

The 1941 output of magnesite in California was the largest since 1917. The 1940-1941 production showed a total of 241,620 net tons of crude magnesite valued at \$2,069,220, of this only a small amount was sold as such. Most of the material was calcined before being marketed. Operators reported a total of 101,999 net tons of calcined material valued at \$3,520,970 rail-shipping point, was made during 1940-1941 and was deadburned for refractories and material for the plastic trade.

In California the known deposits are mostly in the metamorphic rocks of the Coast Ranges and the Sierra Nevada, being associated with serpentine areas. The notable exceptions are the sedimentary deposits at Bissell in Kern County and at Afton in San Bernardino County. Several thousand tons have been shipped from the Bissell deposit; and small shipments have been made from the Afton property. Beginning in 1938, a portion of the market for calcined magnesite is being supplied by magnesium oxide produced from salt-works bitterns at a plant at Newark, Alameda County, on San Francisco Bay. The figures for the crude of above tonnage are included under those for magnesium salts in the Salines chapter.

Total Magnesite Production of California

The first commercial production of magnesite in California was made in the latter part of 1886 from the Cedar Mountain district,¹ southeast of Livermore, Alameda County. Shipments amounting to 'several tons' or 'several carloads' were sent by rail to New York; but there is apparently no exact record of the amount for that first year. The statistical records of the State Mining Bureau began with the year 1887, and the table herewith shows the figures for amount and value, annually, from that time. Shipments of magnesite from Napa County began in 1891 from the Snowflake Mine; from the Red Mountain deposits in Santa Clara County, in 1899; and from Tulare County in 1900.

MARBLE

Bibliography: State Mineralogist Reports XII-XV (inc.), XVII-XXX (inc.), XXXIV, XXXV, XXXVII. Bulletin 38. U. S. Bur. of Mines Bull. 106.

In recent years the marble output has been showing a steady decline as has that of other building stone. The presence of artificial marbles and use of terrazzo which are cheaper is probably the major factor for this. During 1942 in California there was produced in Santa Barbara County some limestone used as building stone and in Solano County some travertine. The annual details were concealed under the 'Unapportioned' item so as not to reveal the output of either operator.

The 1941 production was valued at \$14,448 (including some onyx and travertine from Solano County, and a small amount of limestone used as building stone and flagstone coming from a single operator each in Los Angeles and Santa Barbara counties). The marble came from a single quarry in Tuolumne county.

California has many beautiful and serviceable varieties of marble, suitable for almost any conceivable purpose of construction or decoration. In the decorative class are deposits of onyx marble of beautiful coloring and effects. There is also serpentine marble suitable for electrical switchboard use.

Marble Production of California, by Years

Data on annual production since 1887, as compiled by the State Mining Bureau, follows. Previous to 1894 no records of amounts were preserved.

Total Production of Marble in California, by Years

^a Includes onyx and serpentine.

^b Includes onyx and travertine.

ONYX AND TRAVERTINE

Bibliography: State Mineralogist Reports XII-XV (inc.), XVII, XVIII, XXI, XXIII, XXXI, XXXIV. Bulletin 38.

Onyx and travertine are known to exist in a number of places in California, but there has been only a small and irregular production since the year 1896. In 1942 there was one producer of travertine in Solano County. The 1942 output showed a decrease in both quantity and value from that of 1941, the figures of which are combined with marble. This material is used in terrazzo and for ornamental purposes.

Onyx Production of California, by Years

Production by years has been as follows:

Year	Value	Year	Value
1887.....	*	1926.....	\$7,575
1888.....	\$900	1927.....	*
1889.....	900	1928.....	*

SANDSTONE

Bibliography: State Mineralogist Reports XII-XV, XVII, XVIII, XXI, XXIII, XXVI-XXVIII (inc.), XXXIV, XXXV. Bulletin 38. U. S. Bur. of Mines, Bull. 124.

An unlimited amount of high-grade sandstone is available in California, but the wide use of concrete in buildings of every character, as well as the popularity of a lighter-colored building stone, has curtailed production in this branch of the mineral industry during recent years almost to the vanishing point. In 1942 there was a total of 1,532 tons or about 20,427 cu. ft. of sandstone produced in California valued at \$8,587 at the quarry. This came from two properties in Monterey County; and one each in Colusa, Los Angeles, Napa, San Bernardino, San Luis Obispo, and Shasta counties.

Practically all of the material was flagstone which is used in garden walks, fountains, walls and fireplaces to give effect to Spanish and English types of homes. The material reported from Monterey and San Luis Obispo counties is in reality an indurated shale of the Monterey series, of a cream color and utilized as a building stone.

Sandstone Production of California, by Years

Amount and value, so far as contained in the records of this Bureau, are presented herewith, with total value from 1887 to date:

Year	Cubic feet	Value	Year	Cubic feet	Value
1887.....		\$175,000	1916.....	17,270	\$10,271

SERPENTINE

Bibliography: State Mineralogist Report XV. Bulletin 38.

Serpentine has not been produced in California to a very large extent at any time. A single deposit, that on Santa Catalina Island, has yielded the principal output to date. Some material was shipped from there in 1917 and 1918, being the only output recorded since 1907. It was used for decorative building purposes and for electrical switchboards. As there was but a single operator, the figures were combined with those of marble output for those years.

The production of serpentine prior to 1919 was 'verde antique' which is used as an ornamental stone and often classed as a marble. In recent years experimental tests have proved several possible commercial applications to which this mineral might be put such as an admix in cement, in the manufacture of magnesium chemicals, in terrazzo, as a substitute for soapstone, and as a filler. During 1938 there was a small shipment of serpentine from one property in San Bernardino County. The annual details are concealed in the 'Unapportioned' item so as not to reveal the output of an individual.

Serpentine Production of California, by Years

The following table shows the amount and value of serpentine from 1895 as recorded by this bureau:

Serpentine Production in California, by Years

Year	Cubic feet	Value	Year	Cubic feet	Value
1895.....	4,000	\$4,000	1905.....

SLATE

Bibliography: State Mineralogist Reports XV, XVIII, XXIV, XXVIII, XXXIV. Bulletin 38. U. S. Geol. Surv., Bull. 586. U. S. Bur. of Mines, Bull. 218.

Slate was first produced in California in 1889. Up to and including 1910 such production was continuous, but since then it has been irregular. Large deposits of excellent quality are known in the State, especially in El Dorado, Calaveras and Mariposa counties, but the demand has been light owing principally to competition of cheaper roofing materials.

The slate output in California came from a single property in El Dorado County, the annual details are concealed under the 'Unapportioned' item so as not to reveal the production of an individual. The 1942 production showed an increase in both amount and value over that of 1941, which came from properties in Amador, El Dorado, and Tuolumne counties. The 1941 and 1942 slate output totaled 16,596 tons valued at \$80,321.

Total Production of Slate in California

A complete record of amount and value of slate produced in California follows:

Year	Squares	Value	Year	Squares	Value
1889.....	4,500	\$18,089	1916.....

MISCELLANEOUS STONE

Bibliography: State Mineralogist Reports XII-XXVIII (inc.), XXXI-XXXII, XXXV-XXXVII. Bulletin 38; also annual statistical bulletins from 1915 to date.

'Miscellaneous stone' is the name used throughout this report as the title for that branch of the mineral industry covering crushed rock of all kinds, paving blocks, sand and gravel, and pebbles for grinding mills. The foregoing are very closely related from the standpoint of the producer; therefore it has been found to be most satisfactory to group these items as has been done in recent reports of this Bureau. So far as it has been possible to do so, crushed rock production has been subdivided into the various uses to which the product was put. It will be noted, however, a very large percentage of the output has been tabulated under the heading 'Unclassified.' This is necessary because of the fact that many of the producers have no way of telling to what specific use their rock was put (or at least the proportions to each use) after they have quarried and sold the same to distributors and contractors.

In addition to amounts produced by commercial firms, both corporations and individuals, there is hardly a county in the State but uses more or less gravel and broken rocks on its roads. Of much of this, particularly in the country districts, there is no definite record kept.

During 1942 there was a total of 45,455,085 tons of miscellaneous stone, including sand, gravel, crushed rock, rubble, and riprap produced in California and having a value of \$27,281,342, as compared with 34,626,035 tons worth \$19,559,883 in 1941. The 1942 output was the largest in amount and value ever reported in this State. As in the past Los Angeles County led in the annual output of these products, its 1942 yield being worth \$5,087,331; Alameda County second with an output worth \$3,914,518; Shasta County third with an output worth \$2,581,053; followed in turn by San Bernardino, Sacramento, Riverside, Contra Costa, and Napa counties all with an output worth over a million dollars. Under this heading every county in the State contributed with the exception of Kings and Sutter counties in 1942.

Paving Blocks

The 1942 output of paving blocks came from a single quarry in Sacramento County. The annual details are concealed under the 'Unapportioned' item so as not to reveal production of either operator.

The paving block industry has decreased materially of recent years, practically to the vanishing point, because of the increased construction of smoother pavements demanded by motor vehicle traffic. The blocks made in Solano County were of basalt; those from Sonoma are of basalt, andesite, and some trachyte, while those from Madera, Placer, Riverside, San Bernardino, and San Diego are of granite; and those from San Mateo County a sandstone.

The amount and value of paving block production, annually, since 1887 has been as follows:

Year	Amount M	Value	Year	Amount M	Value
1887	*10,000	\$350,000	1915	3,285	\$171,092
1888	10,500	367,500	1916	1,322	54,362
1889	7,303	297,236	1917	938	38,567
1890	7,000	245,000	1918	372	17,000
1891	5,000	150,000	1919	27	1,350
1892	*3,000	96,000	1920	63	3,155
1893	2,770	96,950	1921	4	280
1894	2,517	66,981	1922	72	3,924
1895	2,332	73,338	1923	15	880
1896	4,161	77,584	1924	11	935
1897	1,711	35,235	1925	27	1,350
1898	1,144	21,725	1926		
1899	305	7,861	1927	41	2,087
1900	1,192	23,775	1928	25	1,658
1901	1,920	41,075	1929		
1902	3,502	112,437	1930		
1903	4,854	134,642	1931	66	5,900
1904	3,977	161,752	1932		
1905	3,408	134,347	1934	2	75
1906	4,203	173,432	1935		
1907	4,604	199,347	1938	9	439

1912	11,018	578,355			
1913	6,364	363,505	Totals	136,004	\$5,356,933
1914	6,053	270,598			

* Figures for 1887-1892 (inclusive) are for Sonoma County only, as none are available for other counties during that period though Solano County quarries were then also quite active.

a Annual details concealed under 'Unapportioned.'

Grinding-Mill Pebbles

The 1942 output of grinding mill pebbles in California came from a single property in San Diego County. The annual details are combined under the 'Unapportioned' item so as not to reveal the output of an individual. The 1942 production was a decrease in amount and value as compared with that of 1941 which came from two properties in San Diego County and one in Calaveras County.

The amount and value of grinding-mill pebbles, annually, follows:

Year	Tons	Value	Year	Tons	Value
1915	340	\$2,810	1931		
1916	20,232	107,567	1932	25	\$211
1917	21,450	90,538	1933		
1918	8,628	61,268	1934	300	3,018
1919	2,607	19,272	1935		
1920	2,104	17,988	1936	961	8,356
1921	247	1,418	1937		
1922	1,571	7,628	1938	960	4,800
1923	2,650	14,936	1939		
1924	434	2,969	1940	482	982
1925	215	1,385	1941

1929					
1930	166	1,225			

* Annual details concealed under 'Unapportioned.'

Sand and Gravel

A considerable part of the gravel excavated is passed through grading and washing plants, and the material over 2 inches in size is crushed. Much of it is utilized in concrete mixtures. Most of the gravel used

for road surfacing and repairs as well as that for railroad ballast is creek-run or pit-run material which is spread upon the roads without undergoing any grading or washing.

The 1942 sand and gravel total output was 27,796,566 net tons valued at \$15,295,252, as compared with 24,836,151 tons worth \$12,127,785 in 1941.

Included in the above total for 1942 are 80,026 net tons of molding sand valued at \$279,383, which came from two properties in Contra Costa County and one each in Los Angeles, Orange, Riverside, Sacramento, San Diego, San Luis Obispo, San Mateo, and Ventura counties. The 1942 output of molding sand showed an increase in both amount and value over the 1941 production which was 57,068 tons worth \$191,614.

The distribution of the 1942 output of sand and gravel by counties is given in the following table:

County	Sand and gravel	
	Tons	Value
Alameda.....	3,630,487	\$2,312,112

^a Combined to conceal output of producers in each.

^a Includes molding sand.

^b Includes filter sand.

^c Includes blast sand.

Crushed Rock

To list the kinds and varieties of rock utilized commercially under this heading would be to run almost the entire gamut of the classification scale. Much depends on the kind available in a given district.

Crushed Rock Production, by Counties, for 1942

County	Macadam and ballast		Rubble and riprap		Concrete		Unclassified		Totals	
	Tons	Value	Tons	Value	Tons	Value	Tons	Value	Tons	Value

* Combined to conceal the output of operators in each.

a Includes decomposed granite.

b Includes slag.

c Includes volcanic cinders.

d Includes granules for roofing and terrazzo.

Those which give the most satisfactory service are the basalts and other hard, dense, igneous rocks which break with sharp, clean edges. In many localities, river-wash boulders form an important source of such material. In such cases, combined crushing and washing plants obtain varying amounts of sand and gravel along with the crushed sizes. In Sacramento and Butte counties the tailings piles from the gold dredgers are the basis of like operations.

The values given are based on the selling price, f. o. b. cars, barges, or trucks, at the quarry. The 1942 output amounted to a total of 17,659,519 tons valued at \$11,986,090 as compared with 9,789,884 tons worth \$7,432,098 in 1941. The accompanying table gives a breakdown of crushed rock by counties.

Miscellaneous Stone Production of California, by Years

The amount and value, annually, of crushed rock (including macadam, ballast, rubble, riprap, and that for concrete), and sand and gravel, since 1893, follow:

Crushed Rock, Sand and Gravel, by Years

Year	Tons	Value	Year	Tons	Value
1893.....	371,000	\$456,075	1919.....	6,919,188	\$3,678,322

			Totals.....	581,471,364	\$378,138,457

A comparison of the above table of annual production of these materials with the similar table for cement (see *ante*) reveals the fact that the important growth of the crushed rock and gravel business was coincident with the rapid development of the cement industry from the year 1902.

CHAPTER FIVE

INDUSTRIAL MATERIALS

Bibliography: State Mineralogist Reports XII-XXXVII (inc.). Bulletin 38. Min. & Sci. Press, Vol. 114, March 10, 1917. Spurr and Wormser, "Marketing of Metals and Minerals." "Non-Metallic Minerals," by R. B. Ladoo. "Industrial Minerals and Rocks," A. I. M. E., 1937. See also under each substance.

The following mineral substances have been arbitrarily arranged under the general heading of 'Industrial Materials,' as distinguished from those which have clearly a defined classification, such as metals, salines, structural materials, etc.

These materials, many of which are mineral earths, are, with four or five exceptions, as yet produced on a comparatively small scale. The possibilities of development along several of these lines are large, and with increasing transportation and other facilities, together with steadily growing demands, the future for this branch of the mineral industry in California is promising. There is scarcely a county in the State but might contribute to the output.

Up to within the last few years, at least, production has been in the majority of instances dependent upon more or less of a strictly local market, and the annual tables show the results of such a condition, not only in the widely varying amounts of a certain material produced from year to year, but in widely varying prices of the same material.

The more important of these minerals thus far exploited, so far as shown by value of the output, are barytes, bentonite (fuller's earth), pottery clay, diatomite, dolomite, gypsum, limestone, mineral water, pumice and volcanic ash, pyrite, silica, and soapstone and talc.

In 1937 the mineral zircon was added to this group. The material mined was used as an abrasive and a refractory.

This group as a whole showed an increase in total value from \$8,502,-571 in 1941 to \$8,606,428 in 1942.

The following table gives the comparative figures for the amounts and value of industrial minerals produced in California during the years 1941 and 1942:

Substance	1941		1942		Increase + Decrease— Value
	Amount	Value	Amount	Value	
Asbestos.....*		*	8,319 lbs.	\$836	* —
Bentonite.....	18,369 tons	\$164,582	7,453 tons	67,503	\$97,097—
Carbon dioxide.....	138,862 M. cu.ft.	258,503	193,143 M cu. ft.	310,000	51,437+
Clay (pottery).....	551,347 tons	1,217,466	622,958 tons	1,200,293	17,173—
Dolomite.....	22,300 tons	64,595	142,552 tons	413,469	348,874+
Gem material.....		870		570	300—
Gypsum.....	432,784 tons	854,184	425,268 tons	791,892	62,292—
Limestone.....	459,153 tons	801,868	474,764 tons	1,155,352	353,484+
Mineral water.....	17,746,256 gals.	988,520	17,559,686 gals.	567,897	420,623—
Pumice and volcanic ash.....	85,309 tons	283,663	55,603 tons	209,539	74,124—
Silica (quartz and glass sand).....	137,660 tons	514,266	193,174 tons	692,762	178,496+
Soapstone and talc.....	47,935 tons	525,396	47,782 tons	545,509	20,113+
Sulphur.....	9,495 tons	209,296		*	* —
Unapportioned.....		\$2,619,302		\$2,650,806	31,504+
Total values.....		\$8,502,571		\$8,606,428	
Net increase.....					\$103,857

* Included under 'Unapportioned.'

a Includes asbestos, barite, calcium silicate, diatomite, feldspar, lithia, mica, mineral paint, pyrite, sillimanite group, strontium, zircon.

b Includes barite, diatomite, feldspar, lithium salts, mineral paint, pyrite, sillimanite group, strontium, and sulphur.

ASBESTOS

Bibliography: State Mineralogist Reports XII-XIX (inc.), XXII, XXVII (inc.), XXIX, XXXI-XXXII, XXXIV-XXXVII (inc.). Bulletins 38, 91. Canadian Dept. of M., Mines Branch Bulletin 69. Min. and Sci. Press, April 10, 1920, pp. 531-533. Eng. & Min. Jour.-Press, Vol. 113, pp. 617-625, 670-677. Asbestology, Vol. 5, No. 7, July, 1927.

During 1942 there was a production of asbestos in California totaling 8,319 pounds and valued at \$836 and coming from a single property each in Napa, Placer, and Shasta counties. The 1942 output was a decrease from 31,741 pounds worth \$2,867 in 1941 which came from a single property each in Inyo and Napa counties.

Of the 1942 output that from Napa County was the chrysotile variety and that from Placer and Shasta counties was tremolite asbestos.

There are two varieties of asbestos, amphibole and serpentine. The most valuable and widely used is the serpentine or chrysotile variety. Chrysotile asbestos has short strong fibers varying in length from $\frac{1}{8}$ of an inch to three inches but mostly less than one inch. The value of the material varies greatly as to the length of the fiber; the longer demanding a premium. It is used as insulation for heat and electricity, in brake linings, steam packing, pipe coverings, in paint, waterproof paper roofing, cement, stucco, and plasters, in heat resisting textiles, as gloves, curtains, cord, etc.

The amphibole variety may be any one of several minerals of the amphibole group, the fibers of this type are weak and often brittle, and they are much more abundant but their uses are limited and value small; being restricted to heat insulation, chemical filters, and sometimes as a filler.

Asbestos Production of California, by Years

Total amount and value of asbestos production in California since 1887, as given in the records of this Bureau, are as follows:

Year	Tons	Value	Year	Tons	Value
1887.....	30	\$1,800	1914.....	51	\$1,530
1888.....	30	1,800	1915.....	143	2,860
1889.....	30	1,800	1916.....	145	2,380

BARITE

Bibliography: State Mineralogist Reports XXII, XIV, XV, XVII, XXI-XXVIII (inc.), XXXIV-XXXV (inc.), XXXVII. Bulletins 38, 87. Eng. & Min. Jour.-Press, Vol. 114, p. 109, July 15, 1922; Vol. 115, pp. 319-324, Feb. 17, 1923. U. S. Bureau of Mines, Inform. Circ. 6221, 6223.

During 1941 the barite (including some witherite) produced in California came from three properties, one each in Mariposa, Nevada and Tulare counties, the annual details being concealed in the 'Unapportioned' items so as not to reveal the output of either operator. This material was consumed in the manufacture of lithopone, a heavy-gravity oil-well drilling-mud, fillers, and barium chemicals.

Commercial production of barite in California for 1940 and 1941 amounted to a total of 57,728 net tons worth \$377,229 f.o.b. rail shipping point.

Barite's largest use in the United States is in the manufacture of lithopone, which is a chemically-prepared white pigment containing approximately 70% barium sulphate and 30% zinc sulphide. This is one of the principal constituents of 'flat' wall paints. Other important uses for barite, after washing and grinding, are as an inert pigment and filler in paint, paper, linoleums, oilcloth and rubber manufacture, and in the preparation of a number of chemicals including barium binoxide, carbonate, chloride, nitrate, the sulphate precipitated, or 'blanc fixe,' and in medicine.

Present (Sept. 23, 1943) quotations for barite (95% BaSO_4) vary from \$8.50 to \$9.00 per ton, crude, f.o.b. rail shipping point. Most barite has to be washed and acid treated to remove iron stains or other impurities before being suitable for paint use.

Known occurrences of this mineral in California are located in Inyo, Los Angeles, Mariposa, Monterey, Nevada, San Bernardino, Shasta, Santa Barbara and Tulare counties. The deposit at El Portal, in Mariposa County, has given the largest commercial production to date, in part witherite (barium carbonate, BaCO_3). Witherite has also been found in Shasta County, but no shipments have yet been made from the deposit. The carbonate is especially desirable, as it is a simpler and hence a cheaper source for preparation of barium chemicals, notably the nitrate which is used in priming mixture for incendiary bombs.

Total Barite Production of California

The first recorded production of barite in California, according to the statistical reports of the State Mining Bureau, was in 1910. The annual figures are as follows:

Year	Tons	Value	Year	Tons	Value
1910.....	860	\$5,640	1927.....	17,993	\$90,617
1911.....	309	2,207	1928.....	13,406	55,888
1912.....	564	2,812	1929.....	26,796	168,829

BENTONITE (Fuller's Earth)

Bibliography: State Mineralogist Reports XIV, XVII, XVIII, XXI, XXIII, XXV-XXVI (inc.), XXXIV, XXXVI-XXXVII. Bulletins 83, 91. U. S. Bureau of Mines, Bulletin 71, Technical Paper 609. Eng. & Min. Jour.-Press, Vol. 121, pp. 837-842, May 22, 1926.

During 1942 the output of bentonite clay amounted to a total of 7,453 net tons, valued at \$67,503, and came from four properties in San Bernardino County, two in Inyo County, and one each in Kern and San Diego counties. The 1942 production showed a decrease in both amount and value as compared with that of 1941, which was 18,369 tons, worth \$164,582.

Previous to 1931 the Division of Mines classed this material under the heading of 'fuller's earth,' but it was thought advisable to change the name to bentonite, owing to the fact that much bentonite is employed in uses that can not be classed as fuller's earth and therefore had been classified in these reports under pottery clay. This was somewhat confusing. Bentonite is the name commonly applied to the clays of the montmorillonite and halloysite group ('rock soap').

Fuller's earth includes many kinds of unctuous clays. It is usually soft, friable, earthy, nonplastic, white and gray to dark green in color, and some varieties disintegrate in water. Production has come mainly from Calaveras and Solano counties, with other deposits noted also in Riverside, Fresno, Inyo and Kern counties.

Bentonite Production of California, by Years

Bentonite including a small amount of fuller's earth was first produced commercially in this State in 1899, and the total amount and value of the output since that time are as follows:

Year	Tons	Value	Year	Tons	Value
1899	620	\$12,400	1922	6,606	\$48,756
1900	500	3,750	1923	3,650	55,125
1901	1,000	19,500	1924	5,290	67,295
1902	987	19,246	1925	5,280	91,842
1903	250	4,750	1926	23,552	250,192
1904	500	9,500	1927	13,018	154,764
1905	1,344	38,000	1928	53,232	501,743

CALCIUM SILICATE

Bibliography: State Mineralogist Report XXXIV, Mining and Metallurgy: Oct., 1935.

During 1942 no output of calcium silicate was reported in California but in 1941 one property in Kern County made some shipments to their mineral wool plant.

The annual details are concealed in the 'Unapportioned' item so as not to reveal its output.

The first commercial production of wollastonite was made in 1933 from a deposit operated by John T. Thorndyke in the Radamacher District in Kern County, and was shipped from Code's Siding to Los Angeles, where it is used to manufacture mineral wool. This was done by a new process in an electric furnace where the material is melted without the use of a flux and then blown to a fine fiber or wool by compressed air from jets. Mineral wool is an excellent insulating material for sound, heat and cold, and the manufacturer expects to use large quantities in proposed steel houses. This material, also, can be used in the manufacture of unbreakable glass. Experiments being conducted for several years by Mr. A. M. M. Russell, Testing Engineer of the State Harbor Commission, shows that wollastonite increases the strength of concrete.

Pyroxene is a silicate of calcium and magnesium and is found in crystalline limestone near the contact with intrusive igneous rocks and in basic igneous rocks such as gabbros. It is white to various shades of green, brown to black, having a hardness of 5 to 6 and a specific gravity 3.2 to 3.6.

Wollastonite is a calcium metasilicate (CaSiO_3) and usually found in crystalline limestone at the contact with intrusive igneous rocks.

It is a white to gray mineral, having a hardness of $4\frac{1}{2}$ to 5 and a specific gravity of about 2.9.

Calcium silicate from 1934 to 1936 was classed in these California mineral production reports as wollastonite.

CARBON DIOXIDE GAS

Bibliography: State Mineralogist Reports XII, XXXVIII.

There were two companies producing carbon dioxide from wells near Niland, Imperial County, and one from springs near Hopland, Mendocino County, to a total of 193,143 M cu. ft. of carbon dioxide gas which was converted into 11,921 net tons of dry ice, worth \$310,000, as compared with 138,862 M cu. ft. of gas which made 8,808 tons of dry ice, worth \$258,563 in 1941. The 1942 output was the largest annual yield of commercial carbon dioxide in California.

Carbon dioxide gas is found many places in nature and is produced commercially from wells and springs whose waters are highly charged with the gas. It is used as a gas in the manufacture of carbonate beverages and dry ice, and in the chemical reduction of carbonates; as dry ice and liquified as a refrigerant, as a source of power, and in the chemical industry. It has been stated that the amount of butyl rubber is only limited by the amount of dry ice available.

Carbon dioxide gas was first produced commercially in California in 1894. This material came from a drift on the 575 level of the Santa Isabel shaft of the New Almaden Quicksilver mine at Almaden, Santa Clara County. The drift was bulkheaded and a pipe was placed through the bulkhead for the gas to be drawn off, it then being compressed into cylinders and used in the manufacture of soda water.

In 1933 carbon dioxide gas was again produced, this time from wells drilled near Niland, Imperial County. On November 1, 1934, a dry-ice plant was put into operation for condensation of the carbon dioxide produced from the above wells.

Carbon Dioxide Gas Production in California, by Years

CLAY (Pottery)

Bibliography: State Mineralogist Reports I, IV, IX, XII-XV, XVIII-XXVIII (inc.), XXX-XXXIII (inc.), XXXV-XXXVII (inc.). Bulletins 38, 99. Preliminary Report No. 7, U. S. Bureau of Standards, Tech. Paper No. 262.

At one time or another in the history of the State, pottery clay has been mined in thirty-four of its counties. Of these, 21 contributed in 1942. In this report, 'pottery clay' refers to all clays used in the manufacture of red and brown earthenware, china and sanitary ware, flower pots, floor, faience and ornamental tiling, architectural terra cotta, sewer pipe, drain and roof tile, etc., and the figures for amount and value are relative to the crude material at the pit without reference to whether the clay was sold in the crude form or was immediately used in the manufacture of any of the above finished products by the producer. It does not include clay used in making brick and hollow building blocks.

There are many other important uses for clay besides pottery manufacture. Among these may be enumerated paper, cotton goods, and chemicals. Clays of the montmorillonite and halloysite group ('rock soap') are being utilized successfully in the manufacture of soaps and for filtering oils and as oil-well drilling mud, also as an earth filler in irrigating ditches which run through porous ground.

During 1942 there was a total of 54 properties in 21 counties which reported an output of 622,958 net tons of pottery clay, valued at \$1,200,-293 f.o.b. rail shipping point for the crude material, as compared with 51 properties in 19 counties producing 51,347 tons worth \$1,217,466 in 1941.

Because of the fact that a given product often requires a mixture of several different clays, and that these are not all found in the same pit, it is necessary for most clay-working plants to buy some part of their raw materials from other localities. For these reasons, in compiling the clay industry figures much care is required to avoid duplications. So far as we have been able to segregate the figures, from the data sent in by the operatives, we have credited the clay output to the counties from which the raw material originated; and have deducted tonnages used in brick manufacture, as bricks are classified separately, herein.

A tabulation of the direct returns from the producers, by counties, for the year 1942 is shown herewith:

Pottery Clay in 1942

County	Tons	Value	Used in the manufacture of
Alameda.....	^a 8,435	\$9,668	Roofing, floor, and mantel tile; chimney, drain, and sewer pipe. Prepared clay, fire clay and sand, and various.
Amador.....	^a 119,596	254,771	Architectural terra cotta; fire clay and refractories; chimney, drain and sewer pipe; floor, mantel, and roofing tile; art pottery; electrical porcelain; and various.
Kern.....	^b 71,172	118,694	Oil well drilling mud.
Los Angeles.....	^b 30,480	67,272	Red earthenware, chimney, drain and sewer pipe; vents; floor, mantel, and roofing tile, art pottery; oil-well drilling mud, and various.
Orange.....	57,885	177,954	Architectural terra cotta; conduits and segment blocks; electrical, porcelain, and chinaware; refractories; vents; drain, floor, and mantel tile; art pottery; and various.
Placer.....	137,565	175,922	Architectural terra cotta; chimney, drain and sewer pipe; faience; floor, mantel, and roofing tile; red earthenware; electrical porcelain; sanitary ware; and various.
Riverside.....	148,887	308,535	Conduit, sewer, and drain pipe; red earthenware; faience, floor, mantel, and roofing tile; and various.
San Bernardino.....	4,757	32,224	Roofing, floor and mantel tile; drain and sewer pipe; red earthenware; refractories; fire sand and various.
San Diego.....	9,902	12,266	Floor, wall and roofing tile, refractories and various.
San Joaquin.....	1,894	4,782	Drain, floor, and roofing tile, ceramic cooking ware, and various.
Butte, Calaveras, Contra Costa, Fresno, Marin, Sacramento, Santa Barbara, Santa Clara, Stanislaus, Sutter, Ventura ^b , *	32,385	38,205	Drain, roofing, and mantel tile; saggars; electrical porcelain; refractories; red earthenware; garden furniture; oil-well drilling mud; sewer, drain, and conduit pipe; prepared clay, light weight aggregate; and various.
Totals.....	622,958	\$1,200,293	

^a Includes fire sand.

^b Includes oil-well drilling mud.

* Combined to conceal the output of operators in each.

The above figures do not include clay reported as used in the manufacture of brick and hollow building tile or the bentonite clays, as these are included under separate headings.

POTTERY CLAY PRODUCTS

The output of pottery clay products manufactured in California during 1942 had a total value of \$16,270,372, and was a decrease from the 1941 total which was \$17,394,733. The distribution by products for 1942 is shown in the following table:

Product	Number of producers	Tons	Value
Architectural terra cotta, chimney pipe, and fueling	9	7,928	\$666,334
Drain tile	14	9,692	170,361
Roofing tile	15	9,969	200,140
Floor, faience, mantel, and handmade tile	14		1,544,030
Sewer pipe	8	159,502	4,379,023
Red earthenware	6		248,096
Stoneware and chemical stoneware	4		341,693
Chinaware and semi-vitreous tableware	7		4,023,367
Electrical porcelain	4		529,482
Conduit tile	3	8,790	220,320
Ground fire clay and high temperature cement	4	10,307	392,893
Miscellaneous: sanitary-ware, plumbing fixtures, clay shapes, gas tank blocks, garden furniture, groud, light-weight aggregate, dolls, vents, saggars, art pottery, specialties, sundries, and various	12		3,554,133
Total value			\$16,250,372

In 1942, ceramic products showed a decrease in total value as compared with 1941 with the exception of sewer pipe, chinaware and semi-vitreous tableware, electrical porcelain, and ground fire clay and high temperature cement.

Pottery Clay Production of California, by Years

Amount and value of crude pottery clay output in California since 1887 are given in the following table:

Year	Tons	Value	Year	Tons	Value
1887	75,000	\$37,500	1916	134,636	\$146,538
1888	75,000	37,500	1917	166,298	154,602
1889	75,000	37,500	1918	112,423	166,788
1890	100,000	50,000	1919	135,708	245,019
1891	100,000	50,000	1920	203,997	440,689
1892	100,000	50,000	1921	225,120	362,172
1893	24,856	67,284	1922	277,232	473,184
1894	28,475	35,073	1923	376,863	697,841

DIATOMITE (Diatomaceous Earth)

Bibliography: State Mineralogist Reports II, XII-XV (inc.), XVII-XXVIII (inc.), XXXI-XXXIII, XXXV-XXXVI. Bulletins 38, 67, 91. Am. Inst. Min. Eng., Bull. 104, Aug. 1915, pp. 1539-1550. U. S. Bur. of Mines, Rep. of Investigations: Serial No. 2341, Jan. 1923. Eng. & Min. Jour.-Press, Vol. 115, pp. 1152-1154, June 30, 1923.

Diatomite, also known as diatomaceous earth, infusorial earth, tripolite and kieselguhr, is very light (when dry a cubic foot weighs 18 to 20 pounds) and extremely porous, chalk-like material composed of pure silica (chalk, being calcareous) which has been laid down under water and consists of the remains of microscopical infusoria and diatoms. The former are animal remains, and the latter are from plants.

The most important deposits in California thus far known are located in Los Angeles, Monterey, Orange, San Luis Obispo, and Santa Barbara counties. The diatomaceous earth of marine origin has proved of superior quality for filtration uses which bring the higher prices. Infusorial or diatomaceous earths are also found in Contra Costa, Fresno, Kern, Plumas, San Benito, San Bernardino, San Joaquin, Shasta, Sonoma, and Tehama counties.

As about 75 percent of the California output is from a single operator, we have concealed the exact figures under the 'Unapportioned' item in the State and county totals. There were four producing properties during 1942, two were in Santa Barbara County, and one each in Los Angeles, and Monterey counties. The shipments during the year showed a decrease in amount and value as compared with 1941.

The material shipped was utilized for insulation of both heat and sound, filtration, paint, pigment, cement admixture, filters, abrasives and for clarification of gasoline and kerosene.

Total Production of Diatomite in California

The first recorded production of these materials in California occurred in 1889; total amount and value of output, to date, are as follows:

Year	Tons	Value	Year	Tons	Value
1889	39	\$1,335	1917	24,301	\$127,510
1890			1918	35,963	189,459
1891			1919	40,200	217,800
1892			1920	60,764	1,056,675
1893	50	2,000	1921

DOLOMITE

Bibliography: State Mineralogist Reports XV, XVII, XXVII, XXVIII, XXXI, XXXIII-XXXIV.

The 1942 output of dolomite in California totaled 142,552 net tons valued at \$413,469 and came from two properties in Monterey County and one each in Inyo, Los Angeles, Riverside, San Benito, and Tuolumne counties, also but not included in the above figures was a tonnage of dolomite from Tuolumne County that was burnt for lime so included in the limestone figures. The 1942 production was the largest annual yield on record here in this State. The 1941 production amounted to 22,300 tons worth \$64,595.

The material shipped during the year was utilized for magnesium metal, for steel furnace flux and refractories, stucco dash, terrazzo, kalsomine, poultry grit, artstone, in mineral-wool, and for the manufacture of carbon dioxide.

Dolomite Production of California, by Years

Previous to the 1915 statistical report of the State Mining Bureau, dolomite was included under limestone, as the two minerals are closely related chemically; but since dolomite, as such, has been found to have certain distinctive applications, we here give it a separate classification.

Amount and value of the output of dolomite, annually, have been as follows:

Year	Tons	Value	Year	Tons	Value
1915-----	4,192	\$14,504	1930)-----	66,564	\$161,245
1916-----	13,313	46,566	1931)-----		
1917-----	27,911	66,416	1932-----	35,275	40,956
1918-----	24,560	79,441	1933-----	54,456	176,575
1919-----	24,502	67,953	1934)-----	108,645	304,984
1920-----	42,388	132,791	1935)-----		
1921-----	31,195	99,155	1936-----	25,807	63,102
1922-----	52,409	114,911	1937-----	12,371	24,632
1923-----	69,519	142,615	1938-----	4,363	18,339
1924-----	28,843	71,271	1939-----	17,791	40,391
1925-----	42,852	104,900	1940-----	18,178	52,167
1926-----	68,640	119,313	1941-----	22,300	64,595
1927-----	45,976	79,442	1942-----	142,552	413,469
1928-----	38,379	85,342			
1929-----	55,644	156,928	Totals-----	1,181,625	\$2,741,994

* Annual details concealed under 'Unapportioned.'

FELDSPAR

Bibliography: State Mineralogist Reports XV, XVII-XXVIII (inc.), XXX, XXXI, XXXIV-XXXVII (inc.). Bulletins 67, 91. U. S. Bureau of Mines, Bulletin 92. Eng. & Min. Jour.-Press, Vol. 115, pp. 535-538, Mar. 24, 1923.

During 1942 feldspar was produced and shipped from three properties in California, one each in Fresno, San Bernardino, and San Diego counties, the annual details being concealed under the 'Unapportioned' item to conceal the output of a property. The above production showed an increase in amount and value over the previous year.

The 1941-1942 total output of feldspar was 10,040 net tons worth \$56,718.

The requirements of the pottery trade demand that in general the percentage of free silica associated with the feldspar be less than 20 percent, and in some cases the potters specify less than 5 percent. An important factor, also, is the iron-bearing minerals frequently present in pegmatites and granites, such as biotite (black mica), garnet, hornblende and black tourmaline. Feldspar for pottery uses should be practically free of these. The white, potash-mica, muscovite, is not particularly objectionable except that being in thin, flexible plates, it does not readily grind to a fineness required for the feldspar. It is also used in the manufacture of glass, enamel and sanitary ware, in soaps and abrasives, and as a binder for abrasive wheels, etc., all of which have similar specifications to that for pottery.

Total Feldspar Production in California

Total amount and value of feldspar production in California since the inception of the industry are given in the following table, by years:

Year	Tons	Value	Year	Tons	Value
1910	760	\$5,720	1925	14,628	\$93,745
1911	740	4,560	1929	13,327	78,404
1912	1,382	6,180	1930	5,014	35,654
1913	2,129	7,350	1931	4,795	59,921
1914	3,530	16,565	1932	2,294	15,988
1915	1,800	9,000	1933	2,655	30,611
1916	2,630	14,350	1934	3,265	21,855
1917	11,792	46,411	1935	3,430	24,959
1918	4,132	22,061	1936	2,686	10,930
1919	1,272	12,965	1937	1,378	6,970
1920	4,518	26,189	1938	2,076	12,510
1921	4,349	28,343	1939	3,022	16,044

1925	8,165	59,615			
1926	7,300	56,400			
1927	10,932	86,101	Totals	159,773	\$1,054,245

* Annual details concealed under 'Unapportioned.'

FLUORSPAR

Bibliography: State Mineralogist Reports XVII, XVIII, XXIV, XXVI. Bulletins 67, 91. Eng. & Min. Jour.-Press, Vol. 177, pp. 489-492, Mar. 22, 1924.

During 1941 there was no commercial production of fluorspar reported in California.

Fluorspar, or calcium fluoride, CaF_2 , is one of the most important nonmetallic minerals from an industrial standpoint. About 80 percent of the commercial mineral is prepared in the 'gravel' form and utilized as a flux in the manufacture of steel, for which use no substitute has yet been found.

In California deposits have been reported in Los Angeles, Mono, Riverside and San Bernardino counties. A previous commercial production was made in 1917-1918, when a total of 79 tons valued at \$991 was shipped from Riverside County, and in 1933-1934 with 227 tons worth \$3,631 coming from San Bernardino County.

Present quotations (Metal and Mineral Markets, Sept. 23, 1943) are: not less than 85 percent CaF_2 and not over 5 percent SiO_2 , \$33 per ton; No. 2 lump, \$33 per ton.

GARNET (Abrasive)

During 1941 the property that shipped abrasive garnets from near Bishop, Inyo County, was shut down. In 1938 and 1939 there were shipments of garnets to the extent of 223 short tons worth \$3,375. This was the first commercial production reported in California. The annual figures are concealed under the 'Unapportioned' item so as not to reveal the output of the operator.

Most garnets are utilized on paper and cloth used for woodworking and shoe manufacture and in sand blasting.

Massive deposits of garnet have been noted in several places in California but little has been done to commercialize them owing to the lack of a market. Recently garnet tailings from some of the tungsten mines have been utilized in airplane factories.

GEMS

Bibliography: State Mineralogist Reports II, XIV, XV, XVII, XVIII, XX, XXI-XXVIII (inc.), XXX-XXXII (inc.), XXXIV-XXXV. Bulletins 37, 67, 91. U. S. G. S., 'Mineral Resources of the U. S.'; Bull. 603, p. 208. Bull. Dept. Geo. Univ. of Cal., Vol. 5, pp. 149-153, 331-380. Am. Jour. Sci., Vol. 31, p. 31.

The production of gem materials in California has been somewhat irregular and uncertain since 1911. The compilation of complete statistics is difficult owing to widely-scattered places at which stones are gathered and marketed, for the most part in a small way. The gem material reported mined and sold during 1942 in California has a total value of \$570. This came from Imperial, Modoc, San Bernardino, and Siskiyou counties and consisted of jasper, moss agate, californite, and iceland spar. The 1942 production showed a decreased value as compared with that of 1941, which was worth \$870.

Varieties of California's Gem Stones

Diamonds have been found in a number of localities in California; but in every case, they have been obtained in stream gravels while working them for gold. The principal districts have been: Volcano in Amador County; Placerville, Smith's Flat and others in El Dorado County; French Corral, Nevada County; Cherokee Flat, Morris Ravine, and Yankee Hill, Butte County; Gopher Hill and upper Spanish Creek, Plumas County. The most productive district of recent years has been Cherokee in Butte County.

California *tourmalines* are decidedly distinctive in coloring and 'fire' as compared to foreign stones of this classification. The colors range from deep ruby to pink, and various shades of green, also blue.

One of our California gem stones, *benitoite*, has not been found elsewhere; and in but a single locality here: The Dallas Mine in San Benito County.

Kunzite, a gem variety of spodumene, was first found in the Pala district in San Diego County. It has thus far been found in only one locality (Madagascar) outside of California. It is of a lilac color, and is described in detail in Bulletin 37 of the State Mining Bureau.

Beryls of excellent fire and delicate colors are also obtained in the Pala district, of which the *aquamarine* (blue) and *morganite* (pink) varieties deserve special mention. *Morganite*, like *kunzite*, has thus far been found elsewhere only in Madagascar.

Californite, or 'California jade,' is a gem variety of *idorase* (*vesuvianite*), and is green or white in color. It is found in Butte, Fresno, and Siskiyou counties.

Stones of precious blue *topaz* of fine quality are being cut from crystals mined in northern San Diego County. They are associated with beryl and blue *tourmaline*.

Some *rhodonite* has been mined in Siskiyou County, and used for decorative purposes, its value being included in the marble figures.

Garnets are found in a number of localities in California; the important yield of gems being *hyacinth* and *spessartite* varieties from San Deigo County.

Chrysoprase has been produced in Tulare County.

Turquoise has been found in the desert section of San Bernardino County, but none produced commercially in recent years.

Sapphires have been reported found in San Bernardino and Riverside counties, but not as yet confirmed. A few have been found in stream gravels with diamonds in Butte County.

Rubies have been identified by the laboratory of the State Mining Bureau, occuring in limestone from the Baldy Mountains, San Bernardino County. Thus far no stones of commercial size have been taken out.

Total Production of Gem Materials in California

The value of the gem output in California annually since the beginning of commercial production is as follows:

Year	Value	Year	Value
1900.....	\$20,500	1923.....	\$13,220
1901.....	40,000	1924.....	4,800
1902.....	162,100	1925.....	10,663

1922.....	1,312		

GRAPHITE

Bibliography: State Mineralogist Reports XVIII, XIV, XV, XVII, XXVI (inc.), XXX, XXXIII, XXXV. Bulletins 67, 91. U. S. G. S., Min. Res. 1914, Pt. II.

Graphite (also called plumbago) has been produced from time to time in the State, coming principally from Sonoma and Los Angeles counties.

Occurrences of graphite have been reported at various times from Calaveras, Fresno, Imperial, Inyo, Los Angeles, Mendocino, San Bernardino, San Diego, Siskiyou, Sonoma and Tuolumne counties. From 1931 to 1933 there was a small production of graphite from a property in Los Angeles County.

During 1942 no production of graphite was reported in California. In 1935 there was a small output of graphite coming from a single property in Los Angeles County. This material was used for experimental purposes. The annual details are concealed under the 'Unapportioned' item in order not to reveal the output of the single operator.

The principal value of graphite is on account of its infusibility and resistance to the action of molten metals. It is also largely used in the manufacture of electrical appliances, of 'lead' pencils, as a lubricant, as stove polish, paints and in many other ways. Amorphous graphite, commonly carrying many impurities, brings a much lower price. For some purposes, such as foundry facings, etc., the low-grade material is satisfactory. Among the interesting uses for graphite is the prevention of formation of scale in boilers. The action is a mechanical one. Being soft and slippery, the graphite prevents the particles of scale from adhering to one another or to the boiler and they are thus easily removed.

Graphite Production of California, by Years

According to the records of the State Mining Bureau, the graphite production of California, by years, has been as follows:

Year	Pounds	Value	Year	Pounds	Value
1901	128,000	\$4,480	1923		
1902	84,000	1,680	1925		
1903			1926	*76,000	\$13,120
1913	2,500	25	1927		
1914			1928		
1915			1931		
1916	29,190	2,335	1932	*156,000	1,950
1917			1933		
1918			1934		
1919			1935	*	*

1921					
1922	*624,000	26,160	Totals	1,869,690	\$86,975

* Annual details concealed under 'Unapportioned,' on account of a single producer.

GYPSUM

Bibliography: State Mineralogist Reports XIV, XV, XVII, XVIII, XXII, XXIII, *XXV-XXVIII (inc.), XXX, XXXI, XXX-XXXVI (inc.). Bulletins 38, 67, 91. U. S. Geol. Surv., Bull. 223, 413, 430, 697. U. S. Bur. of Standards, Circular No. 281.

Shipments of gypsum from California during 1942 amounted to a total of 425,268 net tons, valued at \$791,892, and came from five prop-

erties in Kern County and one each in Fresno, Imperial, Monterey, Riverside, and Ventura counties. In addition to the above figures a considerable amount of gypsum came from Alameda County, which was obtained in a chemical process for reducing magnesium salts from salt-works bittern water with lime, the amount of which was not included in the above figures as it was used with limestone and magnesite. The 1941 output was the largest annual yield both in amount and value and amounted to 432,784 short tons, worth \$854,184.

Uses

The most important use of gypsum from the quantity standpoint is in the calcined form where it is utilized in the manufacture of various hard-wall plasters and plaster board. As plaster of paris, it plays a very important part in surgical work. Approximately 2%, by weight, raw gypsum is added in the manufacture of Portland cement just before the final grinding. In this application, the gypsum acts as a retarder to the set of the cement. The use of gypsum tile for non-bearing fireproof partitions, stairway and elevator enclosures, and the protection of steel columns, girders and beams, has increased greatly.

Keene's cement is a gypsum product, calcined to complete dehydration, and an accelerator added such as alum, potassium sulphate, borax, aluminum sulphate.

Land plaster may be applied to the soil by drilling, or scattered in the hill, or it may be sowed broadcast, in quantities ranging from 200 to 500 pounds to the acre.

Total Production of Gypsum in California

Production of gypsum annually in California since such records have been compiled by this Bureau is as follows:

Year	Tons	Value	Year	Tons	Value
1887.....	2,700	\$27,000	1916.....	33,384	\$59,533
1888.....	2,500	25,000	1917.....	30,825	56,840
1889.....	3,000	30,000	1918.....	19,695	37,176
1890.....	3,000	30,000	1919.....	19,813	50,579
1891.....	2,000	20,000	1920.....	20,507	92,535
1892.....	2,000	20,000	1921.....	37,412	78,875
1893.....	1,620	14,280	1922.....	47,084	188,336

LIMESTONE

Bibliography: State Mineralogist Reports IV, XII-XV (inc.), XVII-XXXI (inc.), XXXIII-XXXV (inc.), XXXVII. Bulletins 38, 91. Oregon Agr. College Extension Bulletin 305. Eng. and Min. Jour.-Press, Vol. 120, pp. 249-253.

'Industrial' limestone was shipped from 22 properties in 12 counties in California during 1942 and totaled 474,764 tons valued at \$1,155,352. The above came from six properties in San Bernardino County; three in El Dorado County; two each in Santa Clara, Santa Cruz, and Tuolumne counties; and one each in Alameda, Inyo, Los Angeles, Riverside, San Luis Obispo, San Mateo, and Ventura counties. The 1941 output came from 19 properties in 10 counties and was 459,153 tons worth \$801,868. Distribution of the 1942 output by counties was as follows:

County	Amount	Value
El Dorado-----	147,469	\$247,522
San Bernardino-----	57,678	148,530
Alameda, Inyo, Los Angeles, Riverside, San Luis Obispo, San Mateo, Santa Clara, Santa Cruz, Tuolumne, and Ventura *-----	269,617	759,300
Totals-----	474,764	\$1,155,352

* Combined to conceal output of individual operators in each.

In the above figures for 1942 are approximately 197,096 tons of limestone used in making 98,548 net tons of burnt lime which was valued at \$961,803. This lime was burnt at two properties each in El Dorado and San Bernardino counties and one each in Alameda, Santa Cruz, and Tuolumne counties. Also included in the 'industrial' limestone for 1942 total is 57,086 tons valued at \$309,936 which was used for agricultural purposes, and in stock feed and poultry grits.

The amount here does not include the limestone used in the manufacture of cement nor for macadam and concrete, but accounts for that utilized as smelter and foundry flux, for glass and sugar making, and other special chemical and manufacturing processes. It also includes that utilized for fertilizers (agricultural 'lime'), 'roofing gravel,' paint and concrete filler, whitening for paint, putty, kalsomine, terrazzo, paving dust, chicken grit, carbon dioxide gas, 'paving compound,' facing dust for concrete pipe, also for rubber and magnesite mix. The material from Alameda, San Mateo, and Santa Clara counties was shells, dredged from San Francisco Bay, which were ground and used for agricultural purposes and poultry grit.

Limestone Production of California, by Years

The following tabulation gives the amounts and values of 'industrial' limestone produced in California by years since 1894 when compilation of such records was begun by the State Mining Bureau. These tonnages consist principally of limestone utilized for flux, glass and sugar making, agricultural, chemical, and other special industrial purposes. That utilized in cement manufacture is not included: Beginning with 1942 the limestone used in the manufacture of burnt lime was included with these figures, instead of being kept separate as a structural material, as most of the lime is being used in metallurgical and chemical industry, and not in construction as in previous years.

Year	Tons	Value	Year	Tons	Value
1894.....	15,420	\$19,275	1920.....	90,120	\$298,197
1895.....	71,355	71,690	1921.....	75,921	305,912

LITHIA

Bibliography: State Mineralogist Reports II, IV, XIV, XXI, XXX, XXXV. Bulletins 38, 67, 91.

During 1942 lithium salts were again produced in California; but coming from a single property, the figures are concealed under the 'Unapportioned' item. Starting with 1938, material came from the brines of Searles Lake in San Bernardino County at the plant of the American Potash and Chemical Corporation, in the form of sodium-lithium phosphate, and was the first output of this kind, previous production being the mineral lepidolite.

Lithia mica, lepidolite (a silicate of lithium and others), utilized in the manufacture of artificial mineral water, fireworks, glass, etc., has been mined in San Diego County since 1899, except between 1905 and 1915, though there was none shipped in 1923, 1925, 1929-1937 (inc.). During 1930 there was a small amount of lepidolite mined in California, but none shipped. Some amblygonite, a lithium phosphate, is occasionally also obtained from pockets associated with the gem tourmalines.

Lithia minerals total production in the State has been as follows:

Year	Tons	Value	Year	Tons	Value
1899.....	124	\$4,600	1923.....

MICA

Bibliography: State Mineralogist Reports II, IV, XXVI-XXVIII (inc.), XXX, XXXIII-XXXVI (inc.). Bulletins 38, 67, 91. U. S. Geol. Surv., Bull. 740; Min. Res. of U. S. Eng. & Min. Jour.-Press, Vol. 115, pp. 55-60, Jan. 13, 1923.

Sericite, a fine-grained variety of Muscovite, has been produced continuously since 1929 in California with the exception of 1934, 1939, and 1942. The 1941 output came from a single property each in Imperial, Inyo, and Mariposa counties. The annual details are concealed in the 'Unapportioned' items so as not to reveal production of the individual operators. The material mined during the year was sericite. Sericite is used as a cheap grade of ground mica for roofing, as a refractory, foundry facing, and decorative material to imitate snow. A small amount of vermiculite, a hydrous mica, expanded by heating and then used as an insulating agent, was mined in 1936.

Classification and Uses

Practically all marketable mica is of the muscovite or phlogopite varieties. There are three main commercial classes: Sheet mica, including punch; splittings, and scrap. Sheet mica is used chiefly for electrical purposes and for glazing; splittings are made into built-up mica; scrap is ground to a powder. Mica to be classified as sheet must yield a rectangle of at least $1\frac{1}{2} \times 2$ in., must split evenly and freely, be free from cracks, rulings, or plications, and reasonably free from inclusions of foreign matter, though stains of a nonconducting character are permissible for some uses. Ability to withstand heat and high electrical resistance have led to a wide application of sheet mica in the electrical industries. The electrical uses of sheet mica greatly exceed all others in quantity and value of the material used.

As a heat-resisting transparent medium, sheet mica has various uses. It is widely employed for stove windows, though this use has declined to a considerable extent. A hard and rigid mica that is nearly clear is best suited for stove fronts. High-grade stove mica commands a higher price than electrical mica, because for the most part larger sizes are demanded. Mica is also used in furnace and bake-oven sight-holes, heat screens, lamp chimneys, canopies and shades, particularly for gas mantels, and also for military lanterns and in lantern slides.

Its ability to withstand shocks and strains, combined with its transparency, has led to wide use in spectacles, drivers' helmets, smoke helmets, compass cards, gage fronts, and in windows subject to shock, as in the conning towers of warships. On account of its heat-resisting qualities, ground mica is used in railroad car axle packings, foundry facing in pipe and boiler coverings, in fireproof paints, and in rubber tires. Ground mica is used as a component in roofing, as a filler in rubber and other products, in foundry facing, calico printing and as a tire powder. It is used also in tinsel decorations, and as 'Santa Claus snow' for Christmas tree and window decorations. It is used as a lubricant for wooden bearings, and mixed with oil for metal bearings.

The vermiculite variety is any of several hydrous mica minerals which expand upon heating. In recent years they have become valuable as an insulating agent for both heat and sound, when being expanded it often takes on a gold or silver color and is used in window decoration.

Production of mica in California has been as follows:

Year	Tons	Value	Year	Tons	Value

MINERAL PAINT

Bibliography: State Mineralogist Reports XII-XIX (inc.), XXI, XXII-XXVIII (inc.), XXXV, XXXVII. Bulletins 38, 91.

During 1942 two properties in California shipped mineral paint, one each in San Bernardino and Stanislaus counties. The 1941-1942 total output was 145 short tons valued at \$1,458. The annual details are concealed under the 'Unapportioned' item so as not to reveal the output of individual producer. This was the first shipment of mineral paint since 1937, when a small amount came from a single property each in Nevada, Placer, and Yuba counties. The material from Nevada and Yuba counties was a limonite and that from Placer County a sienna.

These materials have come from Alameda, Amador, Butte, Calaveras, Colusa, Los Angeles, Napa, Nevada, Placer, Riverside, Shasta, Sonoma, Stanislaus and Ventura counties. There are also other deposits that may have possible commercial value, but as yet there have been no commercial shipments from El Dorado, Imperial, Kern, Kings, Lake, Mendocino, San Diego, Siskiyou, Trinity, and Yuba counties, in which they are found.

Mineral Paint Production of California, by Years

The first recorded production of mineral paint materials in the State was in the year 1890. The output, showing annual amount and value since that time, is given herewith:

Year	Tons	Value	Year	Tons	Value
1890.....	40	\$480	1916.....	643	\$3,960
1891.....	22	880	1917.....	520	2,700

MINERAL WATER

Bibliography: State Mineralogist Reports VI, XII-XVIII (inc.), XXI-XXIX (inc.), XXXI, XXXIII (inc.), XXXV-XXXVII (inc.), U. S. G. S. Water Supply Paper 338. Min. Res., 1914, 1916. 'Mineral Springs and Health Resorts of California,' by Dr. Winslow Anderson, 1890. U. S. Dept. of Agr., Bur. of Chem., Bulletin 91.

A widespread production of mineral water is shown annually in California. These figures refer to mineral water actually bottled for sale, or for local consumption. Water from some of the springs having a special medicinal value brings a price many times higher than the average shown, while in some cases the water is used merely for drinking purposes and sells for a nominal figure. Health and pleasure resorts are located at many of the springs. The waters of some of the hot springs are not suitable for drinking, but are very efficacious for bathing. From a therapeutic standpoint, California is particularly rich in mineral springs.

The commercial output of mineral water in California during 1942 amounted to 17,559,686 gallons valued at \$567,897, as compared with 17,746,256 gallons worth \$988,520 in 1941. The 1942 output came from springs and wells on 36 properties in 16 counties, and was distributed as follows:

<i>County</i>	<i>Gallons</i>	<i>Value</i>
Lake-----	9,100	\$1,800
Los Angeles-----	8,281,287	283,745
Napa-----	41,312	4,890
Sonoma-----	80,697	16,603
Butte, Colusa, Contra Costa, Marin, Orange, Placer, Riverside, San Bernardino, San Diego, San Luis Obispo, Shasta, Siskiyou *	9,147,290	260,859
Totals-----	17,559,686	\$567,897

* Combined to conceal the output of producers in each.

The production above tabulated came either from springs or artesian wells and was bottled, in part with artificial carbonation, but mostly natural, and sold for drinking purposes. A large part was used in the preparation of soft drinks with flavors.

Mineral Water Production of California, by Years

Mineral water was bottled for sale, at the Napa Soda Springs, Napa County, as early as 1856,¹ and at other springs in California, notably The Geysers, Sonoma County, also at early dates; but there are no figures

¹ Cronise, T. F., The natural wealth of California, p. 182, 1868.

available earlier than the year 1887. Amounts and values, annually, since that year are shown herewith:

Year	Gallons	Value	Year	Gallons	Value
1887	618,162	\$144,368	1916	2,273,817	\$410,112
1888	1,112,202	252,990	1917	1,942,020	340,566

PHOSPHATES

Bibliography: State Mineralogist Report XXI. Bulletins 67, 91.

No commercial production of phosphates has been recorded from California, though occasional pockets of the lithium phosphate, amblygonite, Li (AlF) PO₄, have been found associated with the gem tourmaline deposits in San Diego County. Such production has been classified under lithia. In 1938, recovery began on a commercial scale of sodium-lithium phosphate at the plant of the American Potash and Chemical Corporation, at Searles Lake, San Bernardino County. However, the product is sold for its lithium content rather than the phosphate, hence we record it under Lithia.

PUMICE and VOLCANIC ASH

Bibliography: State Mineralogist Reports XII, XIV, XV, XVII, XVIII, XXII-XXV (inc.), XXX-XXXII (inc.), XXXIV-XXXVIII (inc.). Bulletin 38. U. S. Bureau of Mines, I. G. 6560. (See 'Tufa'.)

The output of pumice and volcanic ash in California during 1942 totaled 55,603 short tons, valued at \$209,539 f.o.b. rail shipping point. This material came from three properties each in Inyo and Siskiyou counties, two each in Kern, Madera, and Mono counties; and one each in Modoc, Napa, and San Luis Obispo counties. The 1942 production showed a decrease in both amount and value at compared with that of 1941, which was 85,309 tons, worth \$283,663 and the largest annual output reported in this State.

The material in 1942 from Inyo, Modoc, Mono, Napa, and Siskiyou counties was 45,648 tons of lump pumice, worth \$136,488, which was used for light-weight aggregate in concrete, acoustic plaster, abrasives, scouring bricks, insulating, and hen-house litter; while that from Kern, Madera, and San Luis Obispo counties was 9,955 tons of volcanic ash or tuff variety, worth \$73,051, and was employed in making soap, cleanser compounds, as a filler in concrete, in asphalt, and as a carrier for insecticides in dry agricultural sprays. A portion of the Kern County ash is going into the preparation of one of the nationally advertised brands of cleanser compounds.

Pumice Production of California, by Years

Commercial production of pumice in California was first reported to the State Mining Bureau in 1909, then not again until 1912, since which year there has been a small annual output, as indicated by the following table:

Year	Tons	Value	Year	Tons	Value
1909.....	50	\$500	1927.....	13,779	\$168,896
1910.....			1928.....	10,440	105,055

PYRITES

Bibliography: State Mineralogist Reports XVIII, XIX, XXII, XXV, XXVI, XXX, XXXV. Bulletins 38, 91. Min. and Sci. Press, Vol. 144, pp. 825, 840.

Pyrite, shipped in California during 1942, came from a single property in Shasta County and showed an increase in both quantity and value over that of 1941. The annual details are placed under 'Unapportioned' to conceal the output of the individual operator.

This material was mostly used in the manufacture of sulphuric acid for explosives and fertilizer. Some iron sulphate had been produced previously and was utilized directly in the preparation of an agricultural fertilizer and insecticide. The sulphur content ranged up to 50.8% S.

This does not include the large quantities of pyrite, chalcopyrite, and other sulphides which are otherwise treated for their valuable metal contents. Some sulphuric acid is annually made as a by-product in the course of roasting certain tonnages of Mother Lode auriferous concentrates while under treatment for their precious metal values.

Pyrites Production in California, by Years

The total recorded pyrites production in California to date is as follows:

Year	Tons	Value	Year	Tons	Value
1898.....	6,000	\$30,000	1922.....	151,381	\$570,425
1899.....	5,400	28,620	1923.....	148,004	555,308
1900.....	3,642	21,133	1924.....	124,214	517,835
1901.....	4,578	18,429	1925.....	129,500	528,550
1902.....	17,525	60,306	1926.....	100,896	466,088

SHALE OIL

Bibliography: State Mineralogist Report XIX. U. S. Geol. Surv., Bulletins 322, 729. U. S. Bur. of Mines, Bull. 210, Eng. and Min. Jour.-Press, Vol. 118, No. 8, pp. 290-292, Aug. 23, 1924. Chem. & Met. Eng., Vol. 32, No. 6, Feb. 1925. Min. Congress Jour., Dec. 1924.

Two plants on a more or less experimental scale operated for six years in California, with commercial production beginning in a small way in 1922. The product, in part, was sold for utilization as a flotation oil in metallurgical work, and part consumed as fuel at the plants. There has been no production reported since 1927.

SILICA (Sand and Quartz)

Bibliography: State Mineralogist Reports IX, XIV, XV, XVII, XVIII, XX-XXVIII (inc.), XXXI-XXXIII (inc.), XXXV-XXXVIII (inc.). Bulletins 38, 67, 91.

The 1942 output of silica (quartz and glass sand) in California amounted to a total of 193,174 net tons, valued at \$692,762 f.o.b. rail

shipping point, and came from three properties in San Bernardino County; two in Contra Costa County; and one each in Kern, Mariposa, Orange, Riverside, and San Diego counties. The above consisted of 102,015 tons of glass sand, worth \$432,341, and 91,159 tons of boulder quartz, worth \$260,421, and was the largest output in amount and value ever recorded in this State. The 1941 production consisted of 107,679 tons of glass sand and 29,981 tons of boulder quartz or a total of 137,660 tons, worth \$514,266.

We combine these materials because of the overlapping roles of vein quartz which is mined for use in glass-making and as an abrasive, and that of silica sand which, although mainly utilized in glass manufacture, also serves as an abrasive. Both varieties are also utilized to some extent in fire-brick manufacture.

We do not include under this heading such forms of silica as quartzite, sandstone, flint, tripoli, diatomaceous earth, nor the gem forms of 'rock crystal,' amethyst, and opal. Each of these has various industrial uses, which are treated under their own designations.

The glass sand came from Contra Costa, Orange and Riverside counties. For making the higher grades of glass, deposits in Contra Costa County have replaced the sand imported from Belgium. Belgium sand has displaced local material in the manufacture of sodium silicate ('water glass'). There are various deposits of quartz in California which could be utilized for glass making, but to date they have not been so used owing to the cost of grinding and the difficulty of preventing contamination by iron while grinding.

Silica sand has been produced in the following counties of the State: Alameda, Amador, Contra Costa, El Dorado, Imperial, Inyo, Los Angeles, Mariposa, Mono, Monterey, Orange, Placer, Riverside, San Diego, San Joaquin and Tulare, the chief centers being Contra Costa, Amador, Monterey and Los Angeles counties. The industry is of limited importance, so far, because of the fact that much of the available material is not of a grade which will produce first-class colorless glass; for such, it must be essentially iron-free. Even a fractional percent of iron imparts a green color to the glass.

The Tariff Act of June 21, 1930, placed a duty on sand, containing 95 per cent or more of *Silica* and not more than six-tenths of 1 per cent of oxide of iron and suitable for use in the manufacture of glass, of \$2 per ton.

Total Silica Production in California

Total silica production in California since the inception of the industry, in 1899, is shown below, being mainly sand:

Year	Tons	Value	Year	Tons	Value

SILLIMANITE-ANDALUSITE-KYANITE GROUP

Bibliography: State Mineralogist Reports XX, XXIII, XXIV, XXVII, XXXV-XXXVIII (inc.). Bulletins 67, 91. Dana's Mineralogy. U. S. Geol. Surv., Prof. Paper 110. U. S. Bureau of Mines, Inform. Circ. 6255. Eng. & Min. Jour.-Press. Vol. 120, pp. 91-94, 1925. Amer. Mineralogist, June, 1924.

During 1942 in California shipments of andalusite from Mono County and kyanite from Imperial County were made, the annual details are concealed under 'Unapportioned' item so as not to reveal the output of either operator.

Sillimanite and andalusite are both aluminum silicates (Al_2SiO_5), having the same composition and formula, but with slightly different physical characteristics. Though both crystallize in the orthorhombic system, their crystal habits are different. A massive deposit of andalusite, found in Dry Creek Canyon in the White Mountains of the Inyo Range, in Mono County, is being mined by the Champion Spark Plug Company of Detroit, Michigan. The material is shipped East and utilized in the manufacture of porcelain for automobile spark plugs, for other high-tension electric insulators, laboratory ware and porcelain. Porcelain made from these minerals can be subjected to sudden and extreme changes in temperature without damage.

Kyanite is also an aluminum silicate (Al_2SiO_5), of the same chemical composition as andalusite and sillimanite, but crystallizing in the triclinic system. A deposit of kyanite is being mined in Imperial County, near Ogilby, by the Vitrefrax Corporation and shipments made to their refractory plant in Los Angeles.

Dumortierite, though differing somewhat in composition from the above, being a basic aluminum silicate ($\text{HAl}_3\text{BSi}_3\text{O}_{20}$), has proved similar in behavior in ceramic work so that it is now being mixed with andalusite for electrical porcelains. A deposit of this mineral in

Nevada is being mined for that purpose. Occurrences of massive dumortierite are known in Imperial and San Diego counties in this State and there may yet be some commercial possibilities for them.

SOAPSTONE and TALC

Bibliography: State Mineralogist Reports XII, XIV, XV, XVII-XXVII (inc.), XXX, XXXIII-XXXVII (inc.). Bulletins 38, 67, 91. U. S. Bur. of Mines, Bulletin 213. Rep. of Investigations, Serial No. 2253, May, 1921.

The total production of talc and soapstone in California during 1942 amounted to 47,782 net tons, valued at \$545,509, as compared with 47,935 tons, worth \$525,396, in 1941. The 1942 output had the largest annual value of any year on record in this State although the 1941 output slightly passed it in amount. The 1942 output of high grade talc came from eight properties in Inyo County and three in San Bernardino County; and the soapstone from a single property in El Dorado County.

The talc was utilized mainly in toilet powder, paint, paper, for rubber manufacture, in ceramics, etc. The 'soapstone' grades were used mainly for roofing granules and as a filler in roofing paper and part also as an admix in cement.

It is reported that California talc has replaced to some extent imported talc in the toilet trade on the basis of quality. The largest production of talc in the United States comes from New York and Vermont and of massive soapstone from Georgia.

Composition and Varieties

Talc is hydrous magnesium silicate with the chemical formula $H_2Mg_3(SiO_3)_4$. It is also called soapstone and steatite. The term 'talc' properly includes all forms of the pure mineral, whereas 'steatite' denotes particularly the massive, compact variety, and 'soapstone' the impure, massive forms containing as low as 50% of talc. When pure, talc is soft, having a hardness of 1, but impurities increase the hardness up to 3 or 4. The color varies from pure white and silvery white through gray, green, apple green, to dark green, also yellow, brown, and reddish when impure. It is commonly compact or massive, or in fine granular aggregates, and often in foliated plates or in fibrous aggregates.

Uses

Although the uses of talc and soapstone are many and varied, some of them are not in general well known nor fully developed; and

although few of their uses can justly be considered essential in the sense that no substitute can be used, there are several which are of great importance. The widest use of talc is in the powdered form, and the value depends upon color (whiteness), uniformity, fineness of grain, freedom from grit, 'slip,' and sometimes freedom from lime. The white varieties, free from grit and iron, low in lime, ground to 200-mesh and finer, are largely used as a filler for paper, rubber and paint, and the very highest grade as toilet powder. Ground talc is also used in dressing and coating cloth, in making soap, rope, twine, pipe-covering compounds, heavy lubricants, and polishes, and as a filler in concrete to make it waterproof. Ground talc and soapstone are used in ceramic body for tile and china; for foundry facings, either alone or mixed with graphite and a coarser grade is used in the manufacture of asphalt-coated roofing felts and papers, both as a filler and as a surfacing. Massive close-grained talc, free from iron and grit, is cut into blanks and baked, forming the material used for gas tips and electrical insulation, commonly known as 'lava.' Its hardness, its resistance to heat, acid and alkalies, and its great dielectric strength make it very useful for electric insulation, and no satisfactory substitute for it has been found.

Massive varieties of talc, pyrophyllite, and high grades of soapstone are cut into slate pencils and steel-workers' crayons. 'French chalk' or 'tailor's chalk' is a soft, massive talc. In China, Japan and India, massive talc (steatite) is carved into images and other forms, and is often sold as imitation jade. Soapstone is cut into slabs of 1 and 2 inches in thickness and sold as griddles, footwarmers, and fireless-cooker stones, or fabricated into laundry sinks and tubs, laboratory table tops, hoods, tanks and sinks, electric switchboards, and for other uses in which the properties of resistance to heat, acids and alkalies, and electricity are essential.

Talc Production of California, by Years

Production was intermittent in the State up to 1912; but there has been a material growth since 1916, as shown in the following table:

Year	Tons	Value	Year	Tons	Value
1893	400	\$17,750	1919	8,764	\$115,091
1894			1920	11,327	221,362

STRONTIUM

Bibliography: State Mineralogist Report XXVI, XXVII, XXXV-XXXVI, XXXVIII. Bulletins 67, 91. U. S. G. S. Bull. 540; 660-I.

During 1942 strontium minerals were mined and shipped from two properties in San Bernardino County and one in Imperial County. The annual details are concealed under the 'Unapportioned' item so as not to reveal the output of the individual. The 1941-1942 output totaled 5,671 short tons valued at \$83,069. This material was reported to be used for pyrotechnics (red flares), in the refining of sugar, and in a new alloy of steel.

There was a small shipment of strontianite in 1939 from the deposit near Barstow, San Bernardino County, and this was used in a new steel alloy. The last previous production was in 1918, though in that year both celestite (SrSO_4), and the carbonate, strontianite (SrCO_3) were shipped. The first recorded commercial output of strontium minerals in California was in 1916. The occurrence of the carbonate is particularly interesting and valuable, as it appears to be the only considerable deposit of commercial importance so far opened up in the United States. Shipments reported as averaging 80% SrCO_3 have been made. The deposit is associated with deposits of barite near Barstow, San Bernardino County. The carbonate has also been found in massive form near Shoshone, Inyo County. In addition to Imperial County, celestite is found near Calico and Ludlow, and in the Avawatz Mountains in San Bernardino County, but as yet undeveloped.

The principal use for strontium in the United States is in the form of the nitrate in the manufacture of red flares, or Costen and Bengal lights and fireworks.

Production of strontium minerals in California, by years, has been as follows:

Year	Tons	Value	Year	Tons	Value
1916.....	57	\$2,850	1939.....	2	\$82
1917.....	3,050	37,000	1940.....	627	8,686
1918.....	2,900	33,000	1941.....	5,671	83,069
1919.....			1942.....		
			Totals.....	12,307	\$164,687

* Annual details concealed under 'Unapportioned.'

SULPHUR

Bibliography: State Mineralogist Reports IV, XIII, XIV, XXV, XXXIV, XXXV, XXXVIII. Bulletins 38, 67, 91.

During 1942 in California there was one shipper of sulphur from a single property in Inyo County. The annual details are concealed under the 'Unapportioned' item so as not to reveal the output of an individual. The 1942 output was a decrease from that of 1941 which was 9,750 short tons worth \$209,269 and was the largest annual production in this State. The 1941 output came from a single property each in Imperial and Inyo counties. This mineral has been found to some extent in Alpine, Colusa, Imperial, Inyo, Kern, Lake, Sonoma, Tehama, and Ventura counties.

Total Production of Sulphur in California

Sulphur was produced at the famous Sulphur Bank mine in Lake County, during the years 1865-1868 (inc.) ; following which the property became more valuable for its quicksilver. The Elgin quicksilver mine, near Wilbur Springs, Colusa County, is a similar occurrence.

Production of sulphur in California to date :

Year	Tons	Value	Year	Tons	Value

ZIRCON*Bibliography:* State Mineralogist Report XXXIV.

During 1942 there was no production of zircon reported in California but in 1941 there was a small shipment of zircon sand from near Lincoln, Placer County, to the East Coast to be used in a steel alloy. In 1937 for the first time, zircon was reported in commercial quantities, in this State, from the Kaufeld dragline dredge near Lincoln. They recovered considerable zircon from their black sand but only shipped a small amount for experimental purposes in the manufacture of refractories and as an abrasive in blast sand.

The chief source of zirconium is the mineral zircon, a zirconium silicate, $ZrSiO_4$. Zircon is used, as a gem, being next to the diamond in brilliancy ; as a refractory, molds for steel, insulation in electric heating devices, as a coating on other refractories, coating of welding rods, and in the manufacture of other zirconium compounds.

The metal zirconium is used in radio tubes as an alloy in steel, with copper, etc.

CHAPTER SIX

SALINES

Bibliography: State Mineralogist Reports III, XIV, XV, XVII-XXIX (inc.), XXXIII-XXXVIII (inc.). Bulletin 24. Spurr and Wormser, "Marketing of Minerals." "Non-Metallic Minerals," by R. B. Ladoo. "Industrial Minerals and Rocks," A. I. M. E., 1937. See also under each substance.

Under this heading are included borax, common salt, soda, potash, and other alkaline salts. The first two have been produced in a number of localities in California, more or less regularly since the early sixties. Except for a single year's absence, soda has had a continuous production since 1894. Potash, magnesium chloride and sulphate, and calcium chloride have been added to the commercial list in recent years, joined in 1926 by bromide, and in 1931 by iodine and in 1938 by the alum minerals. The nitrates are still prospective.

Our main resources of salines are the lake beds of the desert regions of Imperial, Inyo, Kern, Los Angeles, San Bernardino, and San Luis Obispo counties, and the waters of the Pacific Ocean.

The total value of the saline group showed an increase from \$11,927,533 in 1941 to \$15,645,003 in 1942, with all substance included under this heading showing an increased output with the exception of magnesium salts.

The following table gives details for each year :

Substance	1941		1942		Increase + Decrease— Value
	Amount	Value	Amount	Value	
Borates.....	224,986 tons	\$4,745,872	203,716 tons	\$4,929,553	\$182,575+
Magnesium salts.....	6,352 tons	654,372	6,206 tons	642,680	11,692—
Salt.....	434,237 tons	1,180,929	672,324 tons	1,922,991	742,062+

Total values.....		\$11,927,533		\$15,645,003	
Net increase.....					\$3,717,470

* Includes bromine, calcium chloride, iodine, and potash.

ALUM MINERALS

Bibliography: State Mineralogist Reports XXXV, XXXVII.

There are several minerals found in California that are considered natural alums. They are hydrous aluminum sulphates combined with sulphates of iron, potassium, sodium or magnesium. The most important are: Alunite, $K_2Al_6(OH)_{12}(SO_4)_4$, a basic hydrous aluminum and potassium sulphate, and Alunogen, $Al_2(SO_4)_3 \cdot 16H_2O$, an hydrous aluminum sulphate.

In 1938 a small production and some development work was done on an alunogen deposit near Corona, Riverside County. This output was the first recorded commercial production reported in California.

The annual details are combined under 'Unapportioned' item to conceal the output of the single operator. An alunite deposit near Glen Ellen, Sonoma County, was opened up several years ago and some development work has been done in hopes of commercializing this mineral.

BORATES

Bibliography: State Mineralogist Reports III, X, XII-XV (inc.), XVII-XXIII (inc.), XXV-XXVII (inc.), XXXIII-XXXIV, XXXVI, XXXVII. Bulletins 24, 67, 91.

During the year, there was produced in California a total of 232,833 net tons of borate material, as compared with 242,419 tons for the preceding year. The material shipped during the year included the sodium borates, kernite (rasorite), kramerite from Kern County; also crystallized borax prepared by evaporation of brines at Searles Lake in San Bernardino County and Owens Lake in Inyo County, and a small amount of colemanite from Death Valley, Inyo County.

As the crude ore is not sold as such, but is almost entirely refined into borax of commerce before shipping, and because of the fact that the material varied widely in boric acid content, we have recalculated the tonnage to a basis of 40 per cent A. B. A. This is approximately the average A. B. A. content of colemanite material after calcining, and also of the crystallized borax obtained from evaporation of the lake brines.

Recalculated, the 1942 output totaled 203,716 net tons, valued at \$4,929,553, as compared with 224,986 tons worth \$4,745,872 for the year 1941. The above came from two properties each in Inyo and San Bernardino counties, and one in Kern County.

Total Production of Borate Materials in California

Borax was first discovered in California in the waters of Tuscan Springs in Tehama County, January 8, 1856. Borax Lake in Lake County was discovered in September of the same year by Dr. John A. Veach. This deposit was worked in 1864-1868, inclusive, and during that time produced 1,181,365 pounds of refined borax. The bulk of it was exported by sea to New York. This was the first commercial output of this salt in the United States, and California is still today the leading American producer of borax, having been for many years the sole producer. California is also the premier world source, today.

Production from the dry lake 'playa' deposits of Inyo and San Bernardino counties began in 1873; but it was not until 1887 that the borax industry was revolutionized by the discovery of the colemanite beds at Calico, in San Bernardino County and later similar beds in Inyo and Los Angeles counties. The colemanite deposits of Ventura County were not worked extensively, owing to lack of transportation facilities. Some production of colemanite has been made from deposits opened up in Clarke County, Nevada. Colemanite was in turn, displaced by the discovery in 1926 of kernite (rasorite) a sodium borate and probertite (kramerite) a hydrous sodium, and calcium borate, near Kramer in Kern County. The brines of Searles Lake are likewise an important source.

The total production of borate materials in California is shown in the following table:

Total Production of Borate Materials in California

Year	Tons	Value	Year	Tons	Value
1864	12	\$9,478	1904	45,647	\$698,810

¹ Refined borax.

² Recalculated to 40% 'anhydrous boric acid' equivalent beginning with 1922.

BROMINE

Bibliography: State Mineralogist Report XXXVII.

The first commercial production of bromine and bromine compounds was begun during 1926 by the California Chemical Corporation in its plant at Chula Vista, San Diego County, from salt-works bittern waters. This same plant has been recovering magnesium chloride for a number of years. Bromine is also now being made at a similar bittern-water plant at Newark, Alameda County, and beginning in 1940 from brines at Searles Lake, San Bernardino County. The 1942 output is an increase in amount and value as compared with that of 1941. The 1942 yield was the largest annual production on record in California; annual details of which are concealed under the 'Unapportioned' item so as not to reveal the production of the single company which operated both plants.

The total commercial production of bromine in California is as follows:

Year	Tons	Value	Year	Tons	Value
1926			1935		
1927	158	\$120,480	1936	805	\$191,465
1928			1937		
1929			1938	914	327,823
1930	802	552,933	1939		
1931			1940	1,579	528,245
1932			1941	2,206	741,790
1933	559	146,547	1942		
1934			Totals	7,023	\$2,609,283

* Annual details concealed under 'Unapportioned.'

CALCIUM CHLORIDE

Bibliography: State Mineralogist Report XXXVII U. S. Geol. Surv. Min. Res. 1919, Pt. II. Engineering and Contracting, Roads and Streets, monthly issue, Feb. 6, 1924. 'How to Maintain Roads,' manual of instruction of Dow Chemical Company.

Calcium chloride is hygroscopic, that is, it has an affinity for water. This property is taken advantage of by utilizing this salt as a drying agent.

During 1942 the production of calcium chloride in California came from one property each in Imperial and San Bernardino counties. The annual details are combined under the 'Unapportioned' item to conceal the output of the operator. The 1942 output showed an increase in both amount and value as compared with that of 1941.

Total Calcium Chloride Production in California

Commercial production of calcium chloride in California was first reported to the State Mining Bureau in 1921, from two plants in San Bernardino County, being obtained as a by-product in the refining of salt from deposits in certain of the desert dry lakes. Total production in California is shown in the following tabulation:

Year	Tons	Value	Year	Tons	Value
1921	683	\$22,980	1934		
1922			1935	4,048	\$16,196
1923	1,204	26,580	1936		
1924			1937	7,227	35,073
1925	10,988	328,876	1938		
1926			1939	7,279	40,182

IODINE

Bibliography: State Mineralogist Reports XXXIV, XXXVI-XXXVII. U. S. Bureau of Mines I. C. 6387.

In 1942 the output of iodine in California came from two plants in Los Angeles County and showed an increase in value as compared

with that of 1941. The annual details for 1942 are combined under the 'Unapportioned' item to conceal the output of either operator. The 1942 production was the largest in amount and value so far reported in this State. The combined 1941-1942 output totaled 979,733 pounds valued at \$1,207,613.

Total Iodine Production in California

Iodine was first produced in California during 1917 to 1921 as a by-product of potash which was reduced from kelp in an experimental station of U. S. Department of Agriculture at Summerland, but after the armistice the demand for these minerals decreased so that the plant in Santa Barbara County closed. In 1929 the General Salt Company erected a plant which reduces iodine from the waste waters of certain deep oil wells in the Long Beach field. During 1933 two more plants started operation, making a total of three producing plants in the State.

Year	Pounds	Value

MAGNESIUM SALTS

Bibliography: State Mineralogist Reports XX, XXI, XXV-XXVI (inc.), XXXIV, XXXVII. Bulletin 91. 'Dictionary of Applied Chemistry,' by Thorpe. U. S. Geol. Surv., Min. Res. of P. S.

There was an output of magnesium salts in California coming from two properties in San Mateo County, and one each in Imperial and San Diego counties, in the amount of 6,260 net tons, valued at \$642,680, compared with 6,352 tons, worth \$654,372 in 1941. The material from Imperial County was magnesium sulphate; from San Diego County magnesium chloride; and that from San Mateo County magnesium carbonate, hydroxide, oxide, and basic carbonate. Also coming from Alameda County was a tonnage of magnesium hydroxide but not included in the above totals as this material was used as magnesite and therefore included under that substance. The chloride was nearly all sold for use in magnesite stucco and cement mixtures (Sorel cement), also some for road liquor. The carbonate, or bulky white powder, was used as a heat-insulating material, as a substitute for magnesite, as a filler for rubber, paper, paint, etc., and in medicines, in tooth paste, in face powder and as a polish for metal and glass. The sulphate market as in past years was utilized for medicinal and bath purposes. The material coming from San Diego County was residual bitters from

the salt plants and was in part marketed in the liquid form carrying from 35% to 67% MgCl_2 and in part as dry crystals, while that from Alameda and San Mateo counties was magnesium carbonate, magnesium hydroxide, and magnesium oxide, obtained by precipitation from sea water.

The average value reported for the chloride produced in California in 1942 was approximately \$38.38 per ton f.o.b. plant, as compared with \$31.63 in 1941.

Total Production of Magnesium Salts in California

Commercial production of magnesium chloride in California was begun in 1916 by some of the salt companies, from the residual bitterns obtained during the evaporation of sea water for its sodium chloride. In addition, some magnesium sulphate, or 'epsom salts' has also been made, but in smaller amount, and magnesium carbonate by a patented process, direct from sea water.

The total production of magnesium salts in California, since the beginning of the industry here, is shown in the following tabulation:

Year	Tons	Value	Year	Tons	Value
1916.....	851	\$6,407	1931 [*]	2,749	\$217,979

NITRATES

Bibliography: State Mineralogist Reports XV, XXV, XXVI, XXVII, XXXIV, XXXVII. Bulletins 24, 67, 91. U. S. G. S., Press Bulletin No. 373, July, 1918. Smithsonian Inst., Publ. No. 2421, 1916.

Nitrates of sodium, potassium and calcium have been found in various places in the desert regions of the State, but no deposit of commercial value has been developed as yet. It is hoped that a closer search may some day be rewarded by workable discoveries. At present the principal commercial source of nitrates is the Chilean saltpeter (sodium nitrate) deposits in South America.

The fixation of atmospheric nitrogen electrically has been accomplished successfully in Germany and Scandinavia. The possibilities of cheap hydroelectric power in California make the subject one of interest to us, as we have also the natural raw materials and chemicals to go with the explosives. Sodium and potassium cyanides can be made by fixation of atmospheric nitrogen electrically.

POTASH

Bibliography: State Mineralogist Reports XV, XVIII, XX, XXII, XXV-XXXVII (inc.), XXXIV, XXXVII. Bulletins 24, 67, 91. U. S. G. S., Min. Res. 1913, 1914, 1915. Senate Doc. No. 190, 62 Congress, 2d Session. Mining & Sci. Press, Vol. 112, p. 155; Vol. 114, p. 789. Eng. & Min. Jour.-Press, Vol. 117, p. 557, Apr. 5, 1924.

The 1942 production of potash in California came from a single operator in San Bernardino County, the details of which are concealed under the 'Unapportioned' item. This was principally chloride and the product averaged 60% equivalent K_2O content. The material was sold mainly for fertilizer manufacture.

Total Production of Potash in California

Potash production began commercially in California in 1914, with a small yield from kelp. Practically all of the output now comes from deposits of potash-bearing residues and brines in the old lake beds of the desert regions, particularly Searles Lake, San Bernardino County. A small amount has been made from salt-works bitterns, and for a time there was some from Portland cement dust. Some also has been obtained from molasses distillery-slops char.

The annual amounts and values of these potash materials, since their beginning in California in 1914, have been as follows:

Year	Tons	Value	Year	Tons	Value
1914.....	10	\$460	1930)*.....	172,263	\$5,500,536
1915.....	1,076	19,391	1931)*.....

SALT

Bibliography: State Mineralogist Reports II, XII-XV (inc.), XVII-XXIII (inc.), XXV-XXVII (inc.), XXXIV-XXXVIII (inc.). Bulletins 24, 67, 91. U. S. Geol. Survey, Bull. 669. U. S. Bur. of Mines, Bull. 146.

Most of the salt production in California is obtained by evaporation of water of the Pacific Ocean, plants being located on the shores of San Francisco, Monterey, and San Diego bays, and at Long Beach. Additional amounts are derived from lakes and lake beds in the desert regions (in part, rock salt), mainly in Imperial, Kern, and San Bernardino counties, and evaporation of alkaline lake water in Modoc County. A small amount of valuable medicinal salts has been obtained

Chart showing diversity in use of salt. By courtesy of Morton Salt Co.

by evaporation of the water of Lake Mono, Mono County, and from a mineral spring in Butte County.

During 1942 there was an output of salt in California totaling 672,-324 net tons valued at \$1,922,991, as compared with 434,237 tons worth \$1,180,929 in 1941.

The 1942 yield was the largest in amount and was surpassed in value only by that of 1929. There were 15 operating plants during the year; four in San Bernardino County, three in Alameda County, two in Imperial County, and one each in Inyo, Kern, Los Angeles, Modoc, Monterey, Orange and San Diego counties.

The overage value reported by salt producers in California in 1942 was \$2.90 per ton, f.o.b. plant, compared with \$2.72 in 1941; \$2.79 in 1940; \$2.75 in 1939; \$2.78 in 1938; \$2.82 in 1937; \$3.08 in 1936; and \$3.36 in 1935.

Production of Salt in California, by Years

Although salt has been made in California since the early '60's, there are no definite or authenticated records for the earlier years before the beginning of the statistical tabulations by the State Mining Bureau.

Amount and value of annual production of salt in California from 1887 is shown in the following tabulation:

Year	Tons	Value	Year	Tons	Value
1887	23,000	\$112,000	1916	136,148	\$455,695
1888	30,800	92,400	1917	227,825	584,373
1889	21,000	63,000	1918	212,076	806,328
1890	8,729	57,085	1919	253,994	896,963
1891	20,094	90,303	1920	230,638	972,648
1892	23,570	104,788	1921	197,989	832,702
1893	50,500	213,000	1922	223,238	819,187
1894	49,131	140,087	1923	275,979	1,130,670
1895	53,031	150,576	1924	318,800	1,159,137
1896	64,743	153,244	1925	284,068	949,826
1897	67,851	157,520	1926	311,761	1,124,978
1898	93,421	170,855	1927	263,028	639,127
1899	82,654	149,588	1928	340,580	1,024,656
1900	89,338	204,754	1929	392,039	2,665,436
1901	126,218	366,376	1930	347,945	1,167,487
1902	115,208	205,876	1931	330,951	1,233,567
1903	102,895	211,365	1932	256,353	918,480
1904	95,968	187,300	1933	321,312	1,251,024
1905	77,118	141,925	1934	332,194	1,222,810
1906	101,650	213,228	1935	365,711	1,230,480
1907	83,063	310,967	1936	398,249	1,227,505

SODA

Bibliography: State Mineralogist Reports XII, XIII, XV, XVII, XVIII, XX, XXII, XXIII, XXV-XXIX (inc.), XXXIV XXXVI-XXXVIII. Bulletins 24, 67, 91. U. S. Geol. Surv., Bull. 717.

The production of sodium salts in California in 1942 included soda ash, and trona, from plants at Owens Lake, Inyo County; and soda ash,

salt cake, and trona (sequi-carbonate, a double salt of Na_2CO_3 and NaHCO_3) from Searles Lake, San Bernardino County. The plant on Dale Lake near Amboy and Searles Lake, San Bernardino County, started operations during the year 1940 and made shipments of salt cake in 1941. There were no shipments of salt cake (sulphate) from Carrizo Plains, San Luis Obispo County. Shipments were made in 1942 amounting to a total of 267,723 net tons valued at \$3,125,078, as compared with 179,210 tons worth \$2,028,718 in 1941. The 1942 output was the largest annual yield as to amount and value and consisted of 145,957 tons of trona and soda ash worth \$2,257,660 and 121,766 tons of salt cake worth \$867,418.

The soda ash was used mainly in the manufacture of soap, glass, paper, oil refining, sugar refining, and chemicals; and the trona for metallurgical purposes. The salt cake or sodium sulphate was used in the manufacture of paper, glass, and in chemicals.

CHAPTER SEVEN

BY COUNTIES

Introductory

The State of California includes a total area of 158,297 square miles, of which 156,803 square miles are of land (according to 1940 census resurvey). The maximum width is 235 miles, the minimum 148 miles, and the length from the northwest corner to the southeast corner is 775 miles. The State is divided into fifty-eight counties. The 1940 census figures show a total population for California of 6,907,387. Minerals of commercial value exist in every county, and during 1940 some active production was reported to the State Division of Mines from all of the fifty-eight.

Rank of Counties in Mineral Yield, 1942

Of the ten leading counties in point of total value of mineral output during 1942, the first four Los Angeles, Kern, Orange, Fresno; and Ventura, sixth; Kings, seventh; and Santa Barbara, eighth owe their position to petroleum and natural gas. Los Angeles County due to its crude oil led all other counties in 1942 and is credited with 26% of the State's mineral value, holding this position since 1923 when it passed Kern County, which led for many years. San Bernardino County, fifth, owes its position to cement, borax, potash, and soda; Sacramento County, ninth, to gold, natural gas and miscellaneous stone; and Santa Clara County, tenth, to cement.

There were thirty-six counties having a mineral production value in excess of a million dollars in 1942. The value of cement, gold, and natural gas exceeded the million dollar mark in eight counties each; petroleum in seven counties; borates and brick and hollow building tile in two counties each; diatomite, potash, quicksilver, soda, and tungsten in one each.

In point of variety and diversity San Bernardino County led all others in 1942 with thirty-three different mineral substances on its commercial list, followed in turn by Inyo County with twenty-one; Los Angeles with nineteen; Kern County with eighteen; Riverside County with sixteen; Imperial and San Diego counties each with fifteen; Fresno and Orange counties each with fourteen; San Luis Obispo County with thirteen; El Dorado, Placer, Santa Barbara, Shasta, and Siskiyou counties each with twelve; Butte, Stanislaus, and Trinity counties each with eleven; Alameda, Amador, Calaveras, Sacramento, and Santa Clara counties each with ten.

Value of Mineral Output by County for 1942:

County	value	County	value
1. Los Angeles	\$106,120,578	31. Placer	\$1,335,042
2. Kern	75,529,067	32. Mariposa	1,321,238
3. Orange	27,508,497	33. El Dorado	1,320,250
4. Fresno	24,790,524	34. San Diego	1,188,661
5. San Bernardino	24,638,661	35. Trinity	1,053,442
6. Ventura	23,084,373	36. San Luis Obispo	1,031,114
7. Kings	12,955,120	37. Tuolumne	854,080
8. Santa Barbara	11,415,045	38. Lake	832,712
9. Sacramento	9,884,746	39. Sierra	640,895
10. Santa Clara	9,204,217	40. Yolo	617,418
11. Inyo	8,134,848	41. Monterey	576,152
12. Riverside	7,271,099	42. Imperial	507,130
13. Alameda	6,112,794	43. Glenn	504,755
14. Nevada	5,956,238	44. Del Norte	401,253
15. Contra Costa	4,066,476	45. Plumas	346,936
16. Shasta	4,025,223	46. Humboldt	294,805
17. San Mateo	3,874,496	47. Marin	229,269
18. Santa Cruz	3,506,972	48. Tulare	168,743
19. Yuba	3,244,771	49. Mono	140,746
20. San Benito	3,104,054	50. Mendocino	133,995
21. Calaveras	2,998,235	51. San Francisco	110,140
22. Solano	2,720,428	52. Sutter	95,438
23. Butte	2,400,858	53. Madera	87,727
24. Amador	2,092,030	54. Modoc	53,330
25. San Joaquin	2,079,078	55. Tehama	47,533
26. Merced	1,848,319	56. Colusa	41,710
27. Sonoma	1,655,326	57. Lassen	35,236
28. Siskiyou	1,620,514	58. Alpine	3,097
29. Stanislaus	1,475,362		
30. Napa	1,447,638	Total value	\$408,738,434

ALAMEDA

Land area: 732 square miles.

Population: 513,011 (1940 census).

Location: East side of San Francisco Bay.

County seat: Oakland.

References: State Mineralogist Report XVII : XVIII : XX : XXVI (Oct., 1929) ; XXXV.

Alameda, while in no sense one of the 'mining counties,' came thirteenth on the list of counties as to value, with a mineral production for 1942 worth \$6,112,794 and had ten different substances. This was an increase over the 1941 output which was valued at \$4,447,145.

Commercial production for 1942 was as follows:

Substance	Amount	Value
Clay (pottery)	8,435 tons	\$9,668
Stone, Miscellaneous		3,914,518
Unapportioned *		2,188,608
Total value		\$6,112,794

* Includes brick and hollow building tile, bromine, copper, gypsum (manufactured from sea water), limestone (shells), magnesite (part from sea water), manganese ore, salt.

ALPINE

Land area: 776 square miles.

Population: 323 (1940 census).

Location: On eastern border of State, south of Lake Tahoe.

County seat: Markleeville.

References: State Mineralogist Report XV : XVII : XVIII : XXVII (Oct., 1931) : XXV : XXXVII.

Alpine County ranked fifty-eighth in value of output for 1942 which was \$3,097, compared with \$6,996 in 1941. The 1942 production was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	17 fine ozs.	\$595
Silver-----	3 fine ozs.	2
Other minerals-----	--	2,500
Total value-----		\$3,097

AMADOR

Land area: 601 square miles.

Population: 8,973 (1940 census).

Location: East-central part of State—Mother Lode District.

County seat: Jackson.

References: State Mineralogist Report XV : XVII : XVIII : XIX : XX : XXII (April, 1927) : XXX : XXXV : XXXVII.

Amador County ranked twenty-fourth as to value of mineral output for 1942 with ten different substances worth \$2,092,030, compared with \$3,724,412 in 1941.

Amador at one time led the State in gold production, though exceeded in 1920-1923 and in 1926-1927 by Yuba and Nevada counties; but in 1925 and 1928 by Yuba only, in 1929-1932 by Nevada only, and in 1931-1936 and 1939-1941 by Nevada and Sacramento, and only ranked 6th in 1942.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Clay (pottery)-----	119,596 tons	\$254,771
Copper-----	1,854 lbs.	224
Gold-----	49,474 fine ozs.	1,731,590
Lead-----	10,559 lbs.	708
Silver-----	11,091 fine ozs.	7,887
Stone, Miscellaneous-----		17,322
Unapportioned *-----		79,538
Total value-----		\$2,092,030

* Includes brick, coal, manganese ore, platinum.

BUTTE

Land area: 1722 square miles.

Population: 42,840 (1940 census).

Location: North-central portion of State.

County seat: Oroville.

References: State Mineralogist Report XV : XVII : XVIII : XXIV : XXVI (Oct., 1930) : XXXI (Jan., 1936).

Butte County ranked twenty-third in regard to value of mineral output in 1942 and fourth in respect to gold, with eleven different substances, having a total value of \$2,400,858 compared with \$3,171,872 in 1941.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	60,916 fine ozs.	\$2,132,060
Silver-----	20,350 fine ozs.	14,471
Stone, Miscellaneous-----		249,337
Unapportioned *-----		4,990
Total value-----		\$2,400,858

* Includes chromite, clay (pottery), copper, lead, mineral water, natural gas, platinum.

CALAVERAS

Land area: 1027 square miles.

Population: 8,221 (1940 census).

Location: East-central portion of State—Mother Lode District.

County seat: San Andreas.

References: State Mineralogist Report XIV:XVII:XVIII:XIX:XX:XXI:XXXII (July, 1936):XXXV:XXXVII.

Calaveras County ranked twenty-first in California in regard to value of mineral output in 1942, and sixth in respect to gold, with a total of \$2,998,235, as compared with \$4,394,039 in 1941.

Commercial production for 1942 consisting of ten different substances, was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper-----	531,618 lbs.	\$64,326
Gold-----	28,004 fine ozs.	980,140
Silver-----	8,380 fine ozs.	5,959
Stone, Miscellaneous-----		22,823
Zinc-----	8,923 lbs.	830
Unapportioned *		1,024,157
Total value-----		\$2,998,235

* Includes cement, chromite, clay (pottery), lead.

COLUSA

Land area: 1140 square miles.

Population: 9,788 (1940 census).

Location: Sacramento Valley.

County seat: Colusa.

References: State Mineralogist Report XIV:XVII:XVIII:XXV (April, 1929):XXXV.

Colusa County ranked fifty-sixth in regard to value of mineral output in 1942, with four different mineral substances, worth a total of \$41,710, as compared with \$41,859 in 1941.

Commercial production for 1942 consisted of mineral water, quicksilver, sandstone, and miscellaneous stone.

CONTRA COSTA

Land area: 714 square miles.

Population: 100,450 (1940 census).

Location: East side of San Francisco Bay.

County seat: Martinez.

References: State Mineralogist Report XVII:XVIII:XXIII (Jan., 1927):XXXV.

Contra Costa County stands fifteenth on the list in respect to value of mineral output for 1942, with eight different substances worth \$4,066,476, as compared with \$3,263,091 in 1941.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Stone, Miscellaneous-----	-----	\$1,153,454
Unapportioned *	-----	2,913,022
Total value-----		\$4,066,476

* Includes brick and hollow building tile, cement, clay (pottery), mineral water, quicksilver, silica (glass sand).

DEL NORTE

Land area: 1024 square miles.

Population: 4,745 (1940 census).

Location: Extreme northwest corner of State.

County seat: Crescent City.

References: State Mineralogist Report XIV : XVII : XXI (July, 1925) : XXIX (Jan.-April, 1933) : XXXIV : XXXV : XXXVII.

Del Norte County was in forty-fourth place as to mineral production for 1942 with five different substances worth \$401,253, as compared with \$112,253 in 1941.

Commercial production in 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	5 fine ozs.	\$175
Silver-----	3 fine ozs.	2
Stone, Miscellaneous-----	--	18,709
Other minerals-----	--	382,367
Total value-----		\$401,253

EL DORADO

Land area: 1753 square miles.

Population: 13,229 (1940 census).

Location: East-central portion of the State, northernmost of the Mother Lode counties.

County seat: Placerville.

References: State Mineralogist Report XV : XVII : XVIII : XIX : XX : XXII (Oct., 1926) : XXXI : XXXIV (July, 1938) : XXXV : XXXVIII.

El Dorado, which contains the location where gold in California was first heralded to the world, comes thirty-third on the list of counties ranked according to value for 1942, with 12 different mineral substances worth \$1,320,250. In addition to the segregated figures here given, a large tonnage of limestone was formerly shipped for use in cement manufacture, the value being included in the State's total for cement. The 1941 output was valued at \$2,294,164.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	18,194 fine ozs.	\$636,790
Limestone-----	147,469 tons	247,522
Silver-----	2,284 fine ozs.	1,624
Stone, Miscellaneous-----	-----	15,396
Unapportioned *-----	-----	418,918
Total value-----		\$1,320,250

* Includes platinum, chromite, copper, lead, slate, soapstone.

FRESNO

Land area: 5950 square miles.

Population: 178,565 (1940 census).

Location: South-central portion of State.

County seat: Fresno.

References: State Mineralogist Report XIV : XVII : XVIII : XXV (July, 1929) : XXXV : XXXVII.

Fresno County, 4th in importance as a mineral producer among the counties of California, reports an output for 1942 of fourteen different

mineral substances, with a total value of \$24,790,524, as compared with the 1941 value of \$23,751,031.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold.....	1,166 fine ozs.	\$40,810
Natural gas.....	59,828,203 M. cu. ft.	2,946,323
Petroleum.....	23,959,303 bbls.	21,206,580

Stone, Miscellaneous.....	-----	391,896
Unapportioned *.....	-----	204,772
Total value.....	-----	\$24,790,524

* Includes brick and hollow building tile, chromite, clay (pottery), feldspar, granite, gypsum, quicksilver, tungsten ore.

GLENN

Land area: 1259 square miles.

Population: 12,195 (1940 census).

Location: West side of Sacramento Valley.

County seat: Willows.

References: State Mineralogist Report XIV : XVII : XVIII : XXXV : XXXVII.

Glenn County stands forty-third as a mineral producing county of the State for 1942, and owes its position to the presence of large deposits of sand and gravel, much of which is used as railroad ballast, and chromite.

Commercial production for 1942 totaled \$504,755 which is an increase from \$33,204, the 1941 total.

HUMBOLDT

Land area: 3634 square miles.

Population: 45,812 (1940 census).

Location: Northwestern portion of State, bordering on Pacific Ocean.

County seat: Eureka.

References: State Mineralogist Report XIV : XVII : XVIII : XXI (July, 1925) : XXXV : XXXVII (Oct., 1941).

Humboldt County ranked forty-sixth in the value of its mineral output among the counties of the State for 1942 with eight different mineral substances valued at \$294,805, compared with the 1941 output worth \$85,267.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper.....	6,409 lbs.	\$775
Gold.....	4,023 fine ozs.	140,805
Silver.....	637 fine ozs.	453
Stone, Miscellaneous.....	-----	66,325
Unapportioned *.....	-----	86,447
Total value.....	-----	\$294,805

* Includes chromite, manganese ore, natural gas.

IMPERIAL

Land area: 4089 square miles.

Population: 59,740 (1940 census).

Location: Extreme southeast corner of the State.

County seat: El Centro.

References: State Mineralogist Report XIV : XVII : XVIII : XIX : XX : XXII (April, 1926) : XXXIV-XXXVI (inc.), XXXVIII (April, 1942).

Imperial County ranked forty-second in total value of mineral output for 1942, with sixteen different mineral substances, worth \$507,130, compared with \$578,808 for 1941.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	174 fine ozs.	\$6,090
Silver-----	169 fine ozs.	129
Stone, Miscellaneous-----	---	62,470
Unapportioned *-----	---	438,450
Total value-----		\$507,130

* Includes calcium chloride, carbon dioxide, copper, lead, gems, gypsum, magnesium chloride, manganese ore, salt, kyanide, salt cake, strontium.

INYO

Land area: 10,019 square miles.

Population: 7625 (1940 census).

Location: Lies on eastern border of State, north of San Bernardino County.

County seat: Independence.

References: State Mineralogist Report XV : XVII : XVIII : XX : XXII (Oct., 1926) : XXVII : XXX : XXXIII : XXXIV (Oct., 1938) : XXXV-XXXVII (inc.).

Quicksilver mine at Coso Hot Springs, Inyo County. Photo by Walter W. Bradley

Inyo County's mineral output for 1942 reached a total value of \$8,134,848, having twenty-one different mineral substances and standing

eleventh among the counties of the State as to value of production. The 1941 yield was worth \$5,020,026.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper-----	753,556 lbs.	\$91,180
Gold-----	11,710 fine ozs.	409,850
Lead-----	10,170,864 lbs.	681,448
Talc-----	29,000 tons	356,345
Silver-----	333,368 fine ozs.	237,062
Stone, Miscellaneous-----	-----	171,559
Zinc-----	680,422 lbs.	63,279
Unapportioned *-----	-----	6,124,125
Total value-----	-----	\$8,134,848

* Includes antimony, bentonite, borates, dolomite, iron ore, limestone, molybdenum ore, pumice, quicksilver, salt, soda, sulphur, tungsten ore.

KERN

Land area: 8003 square miles.

Population: 135,124 (1940 census).

Location: South-central portion of State.

County Seat: Bakersfield.

References: State Mineralogist Report XIV : XVII : XVIII : XIX : XX : XXV (Jan., 1929) : XXIX (July-Oct., 1933) : XXX : XXXIV : XXXVII (inc.).

Kern County, because of its immensely productive oil fields, for many years stood preeminent among all counties of California in the value of its mineral output. It was surpassed by Los Angeles and Orange counties in 1923, but by Los Angeles only in 1924-1942, for which petroleum is responsible; it also rates fifth as a gold producing county. The 1942 production consisted of eighteen different mineral substances valued at \$75,529,067, compared with the 1941 output worth \$70,854,548.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Clay (pottery and oil well drilling mud)-----	71,172 tons	\$118,694
Copper-----	2,172 lbs.	263
Gold-----	56,914 fine ozs.	1,991,990
Gypsum-----	156,104 tons	206,659
Lead-----	17,615 lbs.	1,180
Natural gas-----	70,890,547 M. cu. ft.	3,431,558
Petroleum-----	72,093,741 bbls.	64,477,255
Silver-----	597,683 fine ozs.	425,019
Stone, Miscellaneous-----	-----	449,160
Unapportioned *-----	-----	4,427,289
Total value-----	-----	\$75,529,067

* Includes antimony, bentonite, borates, cement, volcanic ash, salt, silica (quartz), tungsten ore.

KINGS

Land area: 1559 square miles.

Population: 35,168 (1940 census).

Location: South-central portion of the State.

County seat: Hanford.

References: State Mineralogist Report IV : XVII : XVIII : XXVI (Oct., 1930) : XXXV.

Kings County, previous to the discovery of Kettleman Hills oil fields in 1928, had little or no mineral output, but in 1929 it ranked seventh in total value of annual mineral production, seventh in 1930, 1938 and 1941-1942; third in 1931; eighth in 1936-1937; sixth in 1939.

Commercial production for 1942 was as follows :

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Natural gas.....	37,266,063 M. cu. ft.	\$1,821,000
Petroleum.....	8,906,011 bbls.	11,131,160
Other minerals.....	-----	2,960
Total value.....	-----	\$12,955,120

LAKE

Land area: 1278 square miles.

Population: 8,069 (1940 census).

Location: About fifty miles north of San Francisco Bay and the same distance inland from the Pacific Ocean.

County seat: Lakeport.

References: State Mineralogist Report XIV : XVII : XVIII : XX : XXV (July, 1929) : XXXIV : XXXV.

Lake County was in thirty-eighth place as to the value of mineral output for 1942, with six different mineral substances, worth \$832,712, compared with \$1,091,883 in 1941.

Commercial production in 1942 was as follows :

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Mineral water.....	9,100 gals.	\$1,800
Stone, Miscellaneous.....	---	37,591
Unapportioned *.....	---	793,321
Total value.....	-----	\$832,712

* Includes manganese ore, natural gas, quicksilver.

LASSEN

Land area: 4531 square miles.

Population: 14,479 (1940 census).

Location: Northeast portion of State.

County seat: Susanville.

References: State Mineralogist Report XV : XVII : XVIII : XIX : XXV (Jan., 1929) : XXX : XXXII (Oct., 1936).

Lassen County was in fifty-seventh place as a mineral producer for 1942, with an output of \$35,236, compared with \$39,322 which was the value for the previous year.

Commercial production for 1942 included granite and miscellaneous stone.

LOS ANGELES

Land Area: 4067 square miles.

Population: 2,785,643 (1940 census).

Location: One of the southwestern coast counties.

County seat: Los Angeles.

References: State Mineralogist Report XV : XVII : XVIII : XIX : XX : XXIII (July, 1927) : XXX : XXXIII (July, 1937) : XXXIV-XXXVI.

The mineral production of Los Angeles County for the year 1942 amounted in value to \$106,120,578, as compared with the 1941 total worth \$101,657,195. This accounted for 26% of the entire State's total for 1942 and ranked Los Angeles first in the State as a mineral produced.

Commercial production for 1942 consisted of nineteen substances and was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick-----	102,751 M.	\$2,679,889
Hollow building tile-----	3,462 tons	34,910
Clay (pottery and oil well drilling)-----	30,480 tons	67,272
Gold-----	479 fine ozs.	16,765
Mineral water-----	8,281,287 gals.	283,745
Natural gas-----	91,719,975 M. cu. ft.	6,186,796
Petroleum-----	87,248,536 bbls.	90,620,837
Silver-----	229 fine ozs.	163
Stone, Miscellaneous-----	-----	5,087,331
Unapportioned *-----	-----	1,142,870
Total value-----	-----	\$106,120,578

* Includes cement (see county of origin of clinker), copper, diatomite, dolomite, iodine, lead, limestone, salt, sandstone, titanium.

MADERA

Land area: 2112 square miles.

Population: 23,314 (1940 census).

Location: East-central portion of State.

County seat: Madera.

References: State Mineralogist Report XIV : XVII : XVIII : XXIV (Oct., 1928) : XXX : XXXI : XXXIV : XXXVII : XXXVIII.

Madera County was in fifty-third place as a mineral producer for 1942, with an output of six different mineral substances valued at \$87,727, compared with \$180,330 for 1941.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper-----	64,988 lbs.	\$7,864
Gold-----	717 fine ozs.	25,095
Silver-----	242 fine ozs.	172
Unapportioned *-----	-----	54,596
Total value-----	-----	\$87,727

* Includes granite, volcanic ash, miscellaneous stone.

MARIN

Land area: 529 square miles.

Population: 52,907 (1940 census).

Location: Adjoins San Francisco on the north.

County seat: San Rafael.

References: State Mineralogist Report XIV : XVII : XVIII : XXII (July, 1926) : XXIX : XXXV.

Marin County had forty-seventh place as to the value of mineral output for 1942, with five different mineral substances. The total was \$229,269, compared with \$186,322 in 1941.

Commercial production included mineral water, manganese ore, crushed rock, sand and gravel, and pottery clay.

MARIPOSA

Land area: 1453 square miles.

Population: 5,605 (1940 census).

Location: Most southerly of the Mother Lode counties. East central portion of State.

County seat: Mariposa.

References: State Mineralogist Report XIV : XVII : XVIII : XXIV (April, 1928) : XXXI (Jan., 1935) : XXXV : XXXVII.

Mariposa County is one of the distinctly *mining* counties of the State, although it stands but thirty-second on the list of counties in regard to the value of its mineral output for 1942, with a total of \$1,321,238, as compared with \$1,327,594 for 1941. Mariposa County is also the source of a large tonnage of limestone annually, which is otherwise credited to cement manufacture in Merced County.

Commercial production with eight different mineral substances for 1942, was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper-----	26,973 lbs.	\$3,264
Gold-----	29,292 fine ozs.	1,025,220
Lead-----	15,782 lbs.	1,057
Silver-----	9,619 fine ozs.	6,840
Unapportioned *-----	-----	284,857
Total value-----	-----	\$1,321,238

* Includes barite, silica (quartz), miscellaneous stone, manganese ore.

MENDOCINO

Land area: 3452 square miles.

Population: 27,864 (1940 census).

Location: Joins Humboldt County on the south and bounded by the Pacific Ocean on the west.

County seat: Ukiah.

References: State Mineralogist Report XIV : XVII : XVIII : XIX : XX : XXXV.

Mendocino County's mineral output for 1942 was valued at \$133,995 which gave it a rank of fiftieth among the counties of the State as a mineral producer with \$75,074 for 1941.

With six substances, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Stone, Miscellaneous-----	-----	\$57,368
Unapportioned *-----	-----	76,627
Total value-----	-----	\$133,995

* Includes carbon dioxide, chromite, manganese ore, natural gas, quicksilver.

MERCED

Land area: 1995 square miles.

Population: 46,988 (1940 census).

Location: About the geographical center of the State.

County seat: Merced.

References: State Mineralogist Report XIV : XVII : XVIII : XXI (April, 1925) : XXXI (Jan., 1935) : XXXV.

Merced County ranked twenty-sixth as to the value of mineral output for 1942, with six different mineral substances worth \$1,848,319, compared with \$2,579,986 for 1941.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	20,053 fine ozs.	\$701,855
Silver-----	1,942 fine ozs.	1,381
Stone, Miscellaneous-----	-----	184,186
Other minerals-----	-----	960,887
Total value-----	-----	\$1,848,319

MODOC

Land area: 3823 square miles.

Population: 8,713 (1940 census).

Location: The extreme northeast corner of the State.

County seat: Alturas.

References: State Mineralogist Report XV : XVII : XVIII : XXV (Jan., 1929) : XXX : XXXII (Oct., 1936) : XXXV.

Modoc County in fifty-fourth place for 1942, with four different mineral substances, reported a commercial production as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Stone, Miscellaneous-----	----	\$49,778
Unapportioned *-----	----	3,552
Total value-----		\$53,330

* Includes gems, pumice, salt.

MONO

Land area: 3030 square miles.

Population: 2,299 (1940 census).

Location: Is bordered by the State of Nevada on the east and is about in the central portion of the State measured on a north and south line.

County seat: Bridgeport.

References: State Mineralogist Report XV : XVII : XVIII : XX : XXXIII (Oct., 1927) : XXX : XXXIV : XXXV : XXXVI (April, 1940) : XXXVII : XXXVIII.

Mono County is forty-ninth place with nine different mineral substances, reported a commercial production for 1942 as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	1,833 fine ozs.	\$64,155
Silver-----	15,581 fine ozs.	11,080
Unapportioned *-----	----	65,511
Total value-----		\$140,746

* Includes copper, lead, manganese ore, pumice, andalusite, miscellaneous stone, tungsten ore.

MONTEREY

Land area: 3330 square miles.

Population: 73,032 (1940 census).

Location: West-central portion of State, bordering on Pacific Ocean.

County seat: Salinas.

References: State Mineralogist Report XV : XVII : XVIII : XIX : XXI (Jan., 1925) : XXXI : XXXIV : XXXV.

Monterey County had eight different mineral substances during 1942, having a total value of \$576,152, as compared with \$419,372 for 1941.

In forty-first place, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Stone, Miscellaneous-----	----	\$221,239
Unapportioned *-----	----	354,913
Total value-----		\$576,152

* Includes diatomite, dolomite, gypsum, quicksilver, salt, sandstone.

NAPA

Land area: 783 square miles.

Population: 28,503 (1940 census).

Location: Directly north of San Francisco Bay—one of the 'bay counties.'

County seat: Napa.

References: State Mineralogist Report XIV : XVII : XVIII : XX : XXV (April, 1929) : XXXV.

In 1942 the value of Napa County's mineral output was \$1,447,638, placing it in thirtieth place on the list of counties, as compared with \$1,019,184 for 1941.

With seven different mineral substances, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Mineral water.....	41,312 gals.	\$4,890
Unapportioned *	-----	1,442,748
Total value.....	-----	\$1,447,638

* Includes asbestos, pumice, quicksilver, sandstone, miscellaneous stone.

NEVADA

Land area: 974 square miles.

Population: 19,283 (1940 census).

Location: North of Lake Tahoe on the eastern border of the State.

County seat: Nevada City.

References: State Mineralogist Report XVI : XVII : XVIII : XIX : XX : XXVI (April, 1930) : XXXI : XXXII : XXXV : XXXVII (July, 1941).

Nevada County, one of the mountain counties of California, for some years alternated with Amador in the gold lead, but both were passed by Yuba in 1918-1921, also 1923. In 1922, 1924, 1929 to 1942, Nevada led all counties in gold output, though it held third place in 1925 and 1928, and second place in 1926 and 1927. Nevada County stands fourteenth on the list of counties in regard to value of its mineral output for 1942 with seven different mineral substances worth \$5,956,238, as compared with \$10,255,176 for 1941.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper.....	13,299 lbs.	\$1,609
Gold.....	161,593 fine ozs.	5,655,755
Lead.....	14,562 lbs.	976
Silver.....	300,963 fine ozs.	214,018
Unapportioned *	-----	83,880
Total value.....	-----	\$5,956,238

* Includes barite, manganese ore, miscellaneous stone.

ORANGE

Land area: 795 square miles.

Population: 130,760 (1940 census).

Location: Southwest portion of the State, bordering Pacific Ocean.

County seat: Santa Ana.

References: State Mineralogist Report XV : XVII : XVIII : XIX : XX : XXI (Jan., 1925) : XXXI : XXXV : XXXVII.

Orange County, in third place as to value of mineral output for 1942, produced fourteen mineral substances, worth \$27,508,497 compared with \$19,399,481 in 1941.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Clay (pottery)-----	57,885 tons	\$177,954
Gold-----	5 fine ozs.	175
Lead-----	9,286 lbs.	622
Natural gas-----	19,347,357 M. cu. ft.	1,293,338
Petroleum-----	24,122,716 bbls.	25,459,382
Silver-----	3,323 fine ozs.	2,363
Stone, Miscellaneous-----	-----	543,143
Zinc-----	7,450 lbs.	693
Unapportioned *-----	-----	30,827
Total value-----	-----	\$27,508,497

* Includes brick, copper, mineral water, salt, silica (quartz).

PLACER

Land area: 1395 square miles.

Population: 28,108 (1940 census).

Location: Eastern border of State directly west of Lake Tahoe.

County seat: Auburn.

References: State Mineralogist Report XV : XVII : XVIII : XIX : XX : XXIII (July, 1937) : XXXI : XXXII (Jan., 1936).

Placer County, in thirty-first place, with twelve different mineral substances, had a commercial production for 1942 as follows, compared with \$1,759,591 for the previous year:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Clay (pottery)-----	137,565 tons	\$175,922
Copper-----	7,600 lbs.	920
Gold-----	23,291 fine ozs.	815,185
Lead-----	23,559 lbs.	1,579
Silver-----	31,511 fine ozs.	22,408
Stone, Miscellaneous-----	-----	70,782
Unapportioned *-----	-----	248,246
Total value-----	-----	\$1,335,034

* Includes asbestos, brick, chromite, granite, mineral water.

PLUMAS

Land area: 2594 square miles.

Population: 11,548 (1940 census).

Location: Northeastern border of State, south of Lassen County.

County seat: Quincy.

References: State Mineralogist Report XVI : XVII : XVIII : XIX : XX : XXIV (Oct., 1928) : XXIX : XXX : XXXIII (April, 1937), XXXVII.

Plumas County's mineral output for 1942 with seven different mineral substances was valued at \$346,936, as compared with \$2,370,901 in 1941.

In forty-fifth place, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	8,165 fine ozs.	\$285,775
Silver-----	959 fine ozs.	682
Stone, Miscellaneous-----	-----	14,300
Unapportioned *-----	-----	46,179
Total value-----	-----	\$346,936

* Includes chromite, copper, lead, manganese ore.

RIVERSIDE

Land area: 7240 square miles.

Population: 105,524 (1940 census).

Location: Southern portion of State.

County seat: Riverside.

References: State Mineralogist Report XV : XVII : XVIII : XX : XXV (Oct., 1929) : XXX : XXXI : XXXIV-XXXVII, (inc.).

Riverside is the fourth county in the State in size and the twelfth in regard to the total value of mineral output for 1942. Within its borders are included mountains, desert, and agricultural land. In point of variety Riverside County showed sixteen different mineral substances commercially produced in 1942 with a total value of \$7,271,099, as compared with the 1941 output which was valued at \$6,351,012.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Clay (pottery) -----	148,887 tons	\$308,535
Gold -----	348 fine ozs.	12,180
Silver -----	181 fine ozs.	129
Stone, Miscellaneous -----	-----	1,266,888
Unapportioned * -----	-----	5,683,367
Total value -----	-----	\$7,271,099

* Includes brick, cement, copper, dolomite, granite, gypsum, limestone, manganese ore, mineral water, silica (glass sand), tungsten ore.

SACRAMENTO

Land area: 983 square miles.

Population: 170,333 (1940 census).

Location: North-central portion of State.

County seat: Sacramento.

References: State Mineralogist Report XV : XVII : XVIII : XX : XXI (Jan., 1925) : XXXI.

Sacramento stands ninth among the counties of the State as a mineral producer; the output for 1942 being valued at \$9,884,746, as compared with the 1941 production worth \$7,484,001. In regard to gold output alone, this county ranks second, being exceeded by Nevada, the Sacramento product coming from the dredges. With ten different mineral substances, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	125,120 fine ozs.	\$4,379,200
Natural gas -----	49,172,104 M. cu. ft.	3,937,671
Silver -----	6,387 fine ozs.	4,542
Stone, Miscellaneous -----	-----	1,425,785
Unapportioned * -----	-----	137,548
Total value -----	-----	\$9,884,746

* Includes brick and hollow tile, clay (pottery), granite, paving blocks, platinum.

SAN BENITO

Land area: 1392 square miles.

Population: 11,392 (1940 census).

Location: West-central portion of State.

County seat: Hollister.

References: State Mineralogist Report XV : XVII : XVIII : XX : XXII (April, 1926) : XXXIV : XXXV.

San Benito County ranked twentieth among the counties in regard to the value of total mining production for 1942, having an output worth \$3,104,054, as compared with \$1,988, 205 for the previous year.

Commercial output for 1942 included antimony ore, cement, dolomite, quicksilver, sand, gravel, and crushed rock.

SAN BERNARDINO

Land area: 20,157 square miles.

Population: 161,108 (1940 census).

Location: Southeastern portion of State.

County seat: San Bernardino.

References: State Mineralogist Report XV : XVII : XVIII : XIX : XXVI (July, 1930) : XXVII (July, 1931) : XXX : XXXIV-XXXVIII (inc.) : XXXIX (Oct., 1943).

San Bernardino, by far the largest county in the State in area, ranked fifth in regard to the value of mineral output for 1942, with a total of \$24,638,661, as compared with \$16,953,033, the total for 1941.

San Bernardino, for several years (except for 1918) had led all other counties in the State in point of variety of minerals, producing commercially in 1942 a total of thirty-three different substances.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Bentonite.....	5,032 tons	\$48,351
Clay (pottery).....	4,759 tons	32,224
Copper.....	157,195 lbs.	19,021
Gold.....	9,665 fine ozs.	338,275
Lead.....	59,498 lbs.	3,986
Limestone.....	57,678 tons	148,530
Salt.....	156,181 tons	473,760
Talc.....	17,894 tons	185,709
Soda (soda ash and salt cake).....	239,941 tons	2,631,557
Silver.....	65,717 fine ozs.	46,732
Stone, Miscellaneous.....		2,075,901
Zinc.....	579,111 lbs.	53,857
Unapportioned *.....		18,580,756
Total value.....		\$24,638,661

* Includes antimony, borates, brick, bromine, calcium chloride, cement, feldspar, gems, granite, iron ore, lithia salts, manganese ore, mineral paint, mineral water, potash, petroleum, sandstone, silica (quartz) not including gannister, strontium, tungsten ore.

SAN DIEGO

Land area: 4221 square miles.

Population: 289,348 (1940 census).

Location: Extreme southwest corner of State.

County seat: San Diego.

References: State Mineralogist Report XIV : XVII : XVIII : XIX : XX : XXI (July, 1925) : XXX : XXXV (Jan., 1939) : XXXVI-XXXVII.

San Diego ranked thirty-fourth in the total value of its mineral output for the year 1942 with fifteen different mineral substances on the commercial list. The value for 1942 was \$1,188,661, as compared with the 1941 output worth \$1,411,934.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Clay (pottery)-----	9,902 tons	\$12,266
Gold-----	7 fine ozs.	245
Silver-----	3 fine ozs.	2
Stone, Miscellaneous-----	-----	821,816
Unapportioned *-----	-----	604,571
Total value-----	-----	\$1,188,661

* Includes bentonite, brick and hollow tile, bromine, feldspar, granite, magnesium chloride, mineral water, salt, silica (quartz), tube mill pebbles.

SAN FRANCISCO

Land area: 46½ square miles.

Population: 634,536 (1940 census).

County seat: San Francisco.

References: State Mineralogist Report XVII : XVIII : XX : XXV
(April, 1929) : XXXV : XXXVII.

Surprising as it may appear at first glance, San Francisco County is listed among the mineral-producing sections of the State, actual production consisting mainly of crushed rock, sand, gravel, mineral water and gold and silver from beach sands.

In fifty-first place, commercial production for 1942 had a total value of \$110,140 and was miscellaneous stone and gold.

SAN JOAQUIN

Land area: 1448 square miles.

Population: 134,207 (1940 census).

Location: Central portion of State.

County seat: Stockton.

References: State Mineralogist Report XIV : XVII : XVIII : XXI (April, 1925).

San Joaquin County reported a mineral production for 1942 having a total value of \$2,079,078, as compared with \$1,832,622 for 1941.

In twenty-fifth place, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Clay (pottery)-----	1,894 tons	\$4,782
Gold-----	18,103 fine ozs.	633,605
Natural gas-----	11,829,675 M. cu. ft.	839,502
Silver-----	1,762 fine ozs.	1,253
Stone, Miscellaneous-----	-----	475,030
Unapportioned *-----	-----	124,906
Total value-----	-----	\$2,079,078

* Includes brick and hollow tile, manganese ore, platinum.

SAN LUIS OBISPO

Land area: 3334 square miles.

Population: 33,246 (1940 census).

Location: Bordered by Kern County on the east and the Pacific Ocean on the west.

County seat: San Luis Obispo.

References: State Mineralogist Report XV : XVII : XVIII : XXI
(Oct., 1925) : XXXI (Oct., 1935) : XXXV : XXXVII.

The total value of the mineral production of San Luis Obispo County in 1942, with thirteen different mineral substances, was \$1,031,114, as compared with \$572,025 in 1941.

In thirty-sixth place, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold.....	4 fine ozs.	\$140
Stone, Miscellaneous.....	--	212,255
Unapportioned *.....	--	818,719
Total value.....		\$1,031,114

* Includes brick and hollow building tile, chromite, limestone, manganese ore, marble, mineral water, volcanic ash, petroleum, quicksilver, sandstone.

Panning drill cuttings, prospecting chromite ore-body at Castro Mine, near San Luis Obispo, San Luis Obispo County. Photo by Walter W. Bradley

SAN MATEO

Land area: 447 square miles.

Population: 111,782 (1942 census).

Location: Peninsula, adjoined by San Francisco on the north.

County seat: Redwood City.

References: State Mineralogist Report XVII : XVIII : XXV (April, 1929) : XXIX : XXXV.

San Mateo County had a mineral output in 1942 of five different substances, having a total value of \$3,874,496, as compared with \$3,425,263, the value for 1941.

In seventeenth place, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Stone, Miscellaneous.....	--	\$109,901
Unapportioned *.....	--	3,764,595
Total value.....		\$3,874,496

* Includes cement, limestone (shells), magnesium salts.

SANTA BARBARA

Land area: 2740 square miles.

Population: 70,555 (1940 census).

Location: Southwestern portion of State, adjoining San Luis Obispo on the south.

County seat: Santa Barbara.

References: State Mineralogist Report XV : XVII : XVIII : XIX : XXI (Oct., 1925) : XXXII : XXXV.

Santa Barbara County owes its position of eighth place in the State in regard to its mineral output to the presence of productive oil fields within its boundaries. The total value of its mineral production during the year 1942 was \$11,415,045, as compared with \$10,018,726, the output for 1941.

With twelve different substances, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Natural gas-----	2,663,010 M. cu. ft.	\$224,275
Petroleum-----	13,267,311 bbls.	9,407,096
Stone, Miscellaneous-----	-----	155,360
Unapportioned *-----	-----	1,628,314
Total value-----	-----	\$11,415,045

* Includes bituminous rock, brick, clay (pottery), diatomite, copper, gold, quicksilver, silver.

SANTA CLARA

Land area: 1328 square miles.

Population: 174,949 (1940 census).

Location: West-central portion of State.

County seat: San Jose.

References: State Mineralogist Report XVII : XVIII : XX : XXVI (Jan., 1930) : XXIX : XXXV.

Santa Clara County reported a mineral output for 1942 of \$9,-204,217, as compared with \$5,832,076, the figure for 1941.

In tenth place with ten mineral substances, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Stone, Miscellaneous-----	-----	\$283,789
Unapportioned *-----	-----	8,920,428
Total value-----	-----	\$9,204,217

* Includes brick, cement, clay (pottery), limestone (shells), magnesite, manganese ore, petroleum, quicksilver.

SANTA CRUZ

Land area: 435 square miles.

Population: 45,057 (1940 census).

Location: Bordering Pacific Ocean, just south of San Mateo County.

County seat: Santa Cruz.

References: State Mineralogist Report XVII : XVIII : XXII (Jan., 1926) : XXIX.

The mineral output of Santa Cruz County amounted to a total of \$3,506,972 for 1942, giving the county a standing of eighteenth among all others in the State in this regard. The 1941 figure was \$3,206,828.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Stone, Miscellaneous-----	---	\$162,588
Unapportioned *-----	---	3,344,384
Total value-----		\$3,506,972

* Includes bituminous rock, cement, limestone.

SHASTA

Land area: 3858 square miles.

Population: 28,800 (1940 census).

Location: North-central portion of State.

County seat: Redding.

References: State Mineralogist Report XIV : XVII : XVIII : XIX : XXII (April, 1926) : XXIX (Jan., April, 1933) : XXX : XXXIV : XXXV (April, 1939) : XXXVI.

Shasta County stood sixteenth in California among the mineral-producing counties in 1942, with an output valued at \$4,025,223, as compared with the 1941 production worth \$3,758,848.

With twelve different mineral substances, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Stone, Miscellaneous-----	---	\$2,581,053
Unapportioned *-----	---	1,444,170
Total value-----		\$4,025,223

* Includes asbestos, chromite, copper, gold, iron ore, lead, mineral water, pyrite, sandstone, silver.

SIERRA

Land area: 923 square miles.

Population: 3025 (1940 census).

Location: Eastern border of State just north of Nevada County.

County seat: Downieville.

References: State Mineralogist Report XVI : XVII : XVIII : XX : XXV (April, 1929) : XXXI, XXXVIII (Jan., 1942).

Sierra County reported a mineral production of \$640,895 in 1942, which was mainly gold, as compared with the 1941 output, worth \$964,347.

In thirty-ninth place, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	18,030 fine ozs.	\$631,050
Silver-----	2,631 fine ozs.	1,871
Unapportioned *-----	---	7,974
Total value-----		\$640,895

* Includes miscellaneous stone, chromite.

SISKIYOU

Land area: 6256 square miles.

Population: 28,598 (1940 census).

Location: Extreme north-central portion of State, next to Oregon boundary.

County seat: Yreka.

References: State Mineralogist Report XIV : XVII : XVIII : XIX : XX : XXI (Oct., 1925) : XXVIII (Jan., 1931) : XXIX : XXX : XXXI (July, 1935) : XXXIV : XXXV : XXXVII.

Siskiyou, fifth county in California in regard to size, located in highly mineralized and mountainous country, ranks twenty-eighth in regard to mineral output with twelve mineral substances for 1942. The 1941 production was valued at \$2,578,213.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper-----	7,668 lbs.	\$928
Gold-----	38,758 fine ozs.	1,356,530
Silver-----	5,888 fine ozs.	4,187
Stone, Miscellaneous-----	-----	105,952
Unapportioned *-----	-----	152,917
Total value-----	-----	\$1,620,514

* Includes chromite, lead, gems, mineral water, pumice, quicksilver, platinum.

SOLANO

Land area: 822 square miles.

Population: 49,118 (1940 census).

Location: Touching San Francisco Bay on the northeast.

County seat: Fairfield.

References: State Mineralogist Report XIV : XVII : XXIII (April, 1927) : XXXV.

Solano, while mostly valley land, produced mineral substances during 1942 to the total value of \$2,720,428, ranking it twenty-second place among the counties of the State, compared with the 1941 output worth \$1,141,335.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Natural gas-----	29,691,001 M. cu. ft.	\$2,622,523
Stone, Miscellaneous-----	-----	97,500
Other minerals-----	-----	405
Total value-----	-----	\$2,720,428

SONOMA

Land area: 1577 square miles.

Population: 69,052 (1940 census).

Location: South of Mendocino County, bordering on the Pacific Ocean.

County seat: Santa Rosa.

References: State Mineralogist Report XIV : XVII : XVIII : XXII (July, 1926) : XXXV.

Sonoma County ranked twenty-seventh among the counties of California during 1942 with a mineral output valued at \$1,655,326 compared with \$1,187,406, the 1941 figure.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Mineral water-----	80,697 gals.	\$16,603
Stone, Miscellaneous-----	-----	842,512
Unapportioned *-----	-----	796,211
Total value-----	-----	\$1,605,326

* Includes granite (volcanic tuff), manganese ore, quicksilver, natural gas.

STANISLAUS

Land area: 1450 square miles.

Population: 74,866 (1940 census).

Location: Center of State, bounded on south by Merced County.

County seat: Modesto.

References: State Mineralogist Report XIV : XVII : XVIII : XXI (April, 1925) : XXXV.

Gold has usually been the chief mineral product of Stanislaus County, but it was exceeded in 1918-1919 by manganese, and in 1921-1923 and 1925-1930 by miscellaneous stone. This county for 1942 ranked twenty-ninth in the State in regard to minerals, with an output valued at \$1,475,362, as compared with \$1,325,932 in 1941.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold.....	27,795 fine ozs.	\$972,825
Silver.....	2,544 fine ozs.	1,809
Stone, Miscellaneous.....	---	222,241
Unapportioned *.....	---	278,487
Total value.....		\$1,475,362

* Includes clay (pottery), magnesite, manganese ore, mineral paint, quicksilver, platinum, natural gas.

SUTTER

Land area: 608 square miles.

Population: 18,680 (1940 census).

Location: Bounded by Butte County on the north and Sacramento on the south.

County seat: Yuba City.

References: State Mineralogist Report XV : XVII : XVIII.

Sutter is one of only two counties in the State which for a number of years reported no commercial output of some kind of mineral substance. In 1917 some crushed rock was taken out, from the Marysville Buttes, also in 1925-1928, and 1937-1938.

There has been some utilization of natural gas and clay. Coal is found here, but no deposits of it have been placed on a productive basis.

During 1942 there was a commercial output of pottery clay and natural gas, having a total value of \$95,438, which ranked it fifty-second as a mineral-producing county. The 1941 total was \$121,848.

TEHAMA

Land area: 2893 miles.

Population: 14,316 (1940 census).

Location: North-central portion of the State, bounded on the north by Shasta.

County seat: Red Bluff.

References: State Mineralogist Report XV : XVII : XVIII : XIV : XXIV (July, 1928) : XXXVII.

Tehama County stood fifty-second among the mineral-producing counties of the State for 1942, with an output valued at \$47,533, compared with \$2,295 in 1941. Commercial production in 1942 was chromite, crushed rock, sand and gravel.

TRINITY

Land area: 3166 square miles.

Population: 3970 (1940 census).

Location: Northwestern portion of State.

County seat: Weaverville.

References: State Mineralogist Report XIV : XVII : XVIII : XIX : XX : XXII (Jan., 1926) : XXIX (Jan., April, 1933) : XXX : XXXIV : XXXV : XXXVII (Jan., 1941).

Trinity County's output of minerals was valued at \$1,053,442 for 1942, as compared with the 1941 figure of \$1,556,365, mainly due to gold which gives the county a rank of thirty-fifth for the year.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	24,197 fine ozs.	\$846,895
Silver-----	2,814 fine ozs.	2,001
Stone, Miscellaneous-----	---	30,885
Unapportioned *-----	---	173,661
Total value-----		\$1,053,442

* Includes chromite, copper, lead, iron ore, manganese ore, quicksilver, platinum.

TULARE

Land area: 4856 square miles.

Population: 107,152 (1940 census).

Location: Bounded by Inyo on the east, Kern on the south, Fresno on the north.

County seat: Visalia.

References: State Mineralogist Report XV : XVII : XVIII : XX : XXXVI : XXXVII.

Tulare County stands forty-eighth on the list of mineral-producing counties for 1942, with eight different mineral substances, having a total value of \$168,743, as compared with \$272,661 for 1941.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----	134 fine ozs.	\$4,690
Silver-----	57 fine ozs.	41
Stone, Miscellaneous-----	---	30,298
Unapportioned *-----	---	133,714
Total value-----		\$168,743

* Includes brick and hollow tile, manganese ore, natural gas, petroleum, tungsten ore.

TUOLUMNE

Land area: 2190 square miles.

Population: 10,887 (1940 census).

Location: East-central portion of State—Mother Lode District.

County seat: Sonora.

References: State Mineralogist Report XIV : XVII : XVIII : XIX : XX : XXIV (Jan., 1928) : XXXIV : XXXV : XXXVII.

Tuolumne County ranks thirty-seventh among the counties of the State relative to its total value of mineral output for 1942, with eight different substances. This county ranked first as a producer of marble in the State. The mineral production for 1942 was valued at \$854,080, as compared with \$1,142,905 for 1941.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper-----	4,555 lbs.	\$551
Gold-----	12,673 fine ozs.	443,555
Silver-----	3,621 fine ozs.	2,575
Stone, Miscellaneous-----	---	110,390
Unapportioned *-----	---	289,509
Total value-----		\$854,080

* Includes chromite, dolomite, limestone, tungsten ore.

VENTURA

Land area: 1878 square miles.

Population: 69,685 (1940 census).

Location: Southwestern portion of State, bordering on Pacific Ocean.

County seat: Ventura.

References: State Mineralogist Report XV : XVII : XVIII : XX : XXI : XXVIII (July-Oct., 1932) : XXXVII.

Ventura is sixth in the State in respect to the value of its mineral output for 1942. The 1942 mineral production was worth \$23,084,373 as compared with the 1941 output valued at \$21,430,061.

With eight different mineral substances, commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Natural gas-----	37,911,597 M. cu. ft.	\$2,180,252
Petroleum-----	17,853,644 bbls.	20,148,305
Stone, Miscellaneous-----	---	565,218
Unapportioned *-----	---	190,598
Total value-----		\$23,084,373

* Includes clay (oil well drilling), granite (volcanic tuff), gypsum, limestone.

YOLO

Land area: 1017 square miles.

Population: 27,243 (1940 census).

Location: Sacramento Valley, bounded by Sutter on the east and Colusa on the north.

County seat: Woodland.

References: State Mineralogist Report XIV : XVII : XVIII : XXXV.

Yolo County, in fortieth place, had a commercial production for 1942 as follows, compared with \$281,303 the preceding year:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Stone, Miscellaneous-----	---	\$150,066
Unapportioned *-----	---	467,352
Total value-----		\$617,418

* Includes natural gas and quicksilver.

YUBA

Land area: 639 square miles.

Population: 17,034 (1940 census).

Location: Lies west of Sierra and Nevada counties; south of Plumas.

County seat: Marysville.

References: State Mineralogist Report XV : XVII : XVIII : XX : XXVI (July, 1930) : XXXI.

Yuba County ranked nineteenth among the counties of the State as a mineral producer and third in respect to gold, which is obtained mainly by dredges. The 1941 output was valued at \$3,265,986.

Commercial production for 1942 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold.....	75,595 fine ozs.	\$2,645,825
Silver.....	5,101 fine ozs.	3,627
Stone, Miscellaneous.....	----	589,034
Other minerals.....	----	6,285
Total value.....	-----	\$3,244,771

CHAPTER EIGHT

DIRECTORY OF PRODUCERS OF METALLIC AND NON-METALLIC MINERALS IN CALIFORNIA 1942

NOTE.—The producers of natural gas and petroleum will be found in the quarterly Summary of Operations, California Oil Fields, for July to December, 1942 (Vol. 28, No. 2).

ANTIMONY

Operator	Address	Location of mine
<i>Inyo County</i> Bishop Antimony Mining Co., c/o R. S. Beatty, Jr. Darwin Antimony #1, James B. Utt.	P.O. Box 326, Bishop. 514½ N. Main St., Santa Ana.	Bishop Darwin

a. Soda ash. c. Salt cake. d. Trona.

STONE, MISCELLANEOUS

Under the heading of 'miscellaneous stone' there are four divisions—crushed rock, grinding mill pebbles, paving blocks, and sand and gravel. Crushed rock includes crushed rock that is used in macadam, ballast and for concrete; also rock used for rubble and riprap.

NOTE.—The California State Highway Commission, the various counties, U. S. Forest Service and U. S. Bureau of Public Roads produce both crushed rock and sand and gravel in various places in the State used in construction and maintenance of highways, but not specified in this listing.

APPENDIX

PUBLIC RESOURCES CODE

An act to establish a Public Resources Code, thereby consolidating and revising the law relating to natural resources, the conservation, utilization, and supervision thereof, and matters incidental thereto, and to repeal certain acts and parts of acts specified herein.

Chapter 93 (Stats. 1939.)

The people of the State of California do enact as follows:

GENERAL PROVISIONS

1. This act shall be known as the Public Resources Code.
2. The provisions of this code, in so far as they are substantially the same as existing provisions relating to the same subject matter shall be construed as restatements and continuations thereof and not as new enactments.
3. All persons who, at the time this code goes into effect, hold office under any of the acts repealed by this code, which offices are continued by this code, continue to hold the same according to the former tenure thereof.
4. No action or proceeding commenced before this code takes effect, and no right accrued, is affected by the provisions of this code, but all procedure thereafter taken therein shall conform to the provisions of this code so far as possible.
5. Unless the context otherwise requires, the general provisions hereinafter set forth shall govern the construction of this code.
6. Division, part, chapter, article, and section headings contained herein shall not be deemed to govern, limit, modify or in any manner affect the scope, meaning, or intent of the provisions of any division, part, chapter, article, or section hereof.
7. Whenever, by the provisions of this code, an administrative power is granted to a public officer or a duty imposed upon such officer, the power may be exercised or the duty performed by a deputy of the officer or by a person authorized pursuant to law.
8. Writing includes any form of recorded message capable of comprehension by ordinary visual means. Whenever any notice, report, statement or record is required by this code, it shall be made in writing in the English language.
9. Whenever any reference is made to any portion of this code or of any other law of this State, such reference shall apply to all amendments and additions thereto now or hereafter made.
10. "Section" means a section of this code unless some other statute is specifically mentioned.
11. The present tense includes the past and future tenses; and the future the present.
12. The masculine gender includes the feminine and neuter.
13. The singular number includes the plural, and the plural the singular.
14. "County" includes "city and county."
15. "Shall" is mandatory and "may" is permissive.
16. "Oath" includes affirmation.
17. "Signature" or "subscription" includes mark when the signer or subscriber can not write, such signer's or subscriber's name being written near the mark by a witness who writes his own name near the signer's or subscriber's name; but a signature or subscription by mark can be acknowledged or can serve as a signature or subscription to a sworn statement only when two witnesses so sign their own names thereto.
18. If any provision of this code, or the application thereof to any person or circumstances, is held invalid the remainder of the code, and the application of its provisions to the other persons or circumstances, shall not be affected thereby.

DIVISION 1. THE DEPARTMENT OF NATURAL RESOURCES

501. There is in the State government a Department of Natural Resources. The department shall be conducted under the control of an executive officer known as the Director of Natural Resources. The director shall be appointed by and hold office at the pleasure of the Governor and shall receive a salary of six thousand dollars a year.

502. Except as in this division otherwise provided, the provisions of Article 2, Chapter 3, Title 1, Part 3 of the Political Code shall govern and apply to the conduct of the Department of Natural Resources in every respect the same as if such provisions were herein set forth at length, and wherever in that article the term "head of the department" or similar designation occurs, it shall for the purposes of this division mean the Director of Natural Resources.

503. For the purposes of administration the department shall be organized by the director, subject to the approval of the Governor, in such manner as he deems necessary properly to segregate and conduct the work of the department. The director may appoint, in accordance with the civil service and other provisions of law, such deputies, officers, and other expert and clerical assistants as may be necessary.

504. The work of the department shall be divided into at least four divisions, known as Division of Forestry, the Division of Parks, The Division of Fish and Game, and The Division of Mines.

505. The Division of Forestry shall be administered through a chief who shall be known as the State Forester. He shall be a technically trained forester, appointed by the director upon nomination by the State Board of Forestry. General policies for the guidance of the Division of Forestry shall be determined by a State Board of Forestry which shall consist of seven members appointed by and holding office at the pleasure of the Governor. Of the seven members one shall be familiar with the pine timber industry, one with the redwood industry, one with live stock industry, one with general agriculture, and one with the problems of water conservation.

506. The Division of Parks shall be administered through a chief who shall be appointed by the director upon nomination by the State Park Commission. General policies for the administration of the State park system shall be determined by the State Park Commission which shall consist of five members appointed by and holding office at the pleasure of the Governor.

507. The Division of Mines shall be administered through a chief who shall be known as the State Mineralogist. He shall be a technically trained mining engineer, appointed by the director upon nomination by the State Mining Board. General policies for the guidance of the Division of Mines shall be determined by a State Mining Board, which shall consist of five members appointed by and holding office at the pleasure of the Governor.

508. The Division of the Department of Natural Resources for the supervision of oil and gas shall be in charge of a chief, known as the State Oil and Gas Supervisor.

509. The salaries of the chiefs of the Divisions of Forestry and Parks shall be fixed by the director with the approval of the Governor. The director and the chief of each division, before entering upon his duties, shall execute and deliver to the State an official bond in the sum of twenty-five thousand dollars conditioned upon the faithful performance of his duties.

510. The members of the Board of Forestry and the State Park Commission shall serve without compensation, but shall be entitled to their actual necessary expenses incurred in the performance of their duties.

512. The Department of Natural Resources may expend the money in any appropriation or in any special fund in the State treasury made available by law for the administration of the statutes the administration of which is committed to the department, or for the use, support, or maintenance of any board, bureau, commission, department, office, or officer whose duties, powers, and functions have been transferred to and conferred upon the department. Such expenditures by the department shall be made in accordance with law in carrying out the purposes for which the appropriations were made or the special funds created.

513. The department shall have possession and control of all records, books, papers, offices, equipment, supplies, moneys, funds, appropriations, land and other

property, real or personal held for the benefit or use of all bodies, offices, and officers whose duties, powers, and functions have been transferred to and conferred upon the department.

514. Nothing in this code is intended to supersede, modify or change the effect of the enactment of section 373g of the Political Code, and wherever in this code reference is made to any officer or agency of the Department of Natural Resources, it is made in the sense and with the same legal effect as was attributable thereto in the statute whence derived and which would continue to be so attributable but for the adoption of this code.

DIVISION 2. MINES AND MINING

CHAPTER 1. DEFINITIONS

2001. Unless the context otherwise requires, the definitions hereinafter set forth shall govern the construction of Division 2 of this code.

2002. "Department" in reference to the government of this State, means the Department of Natural Resources.

2003. "Division" in reference to the government of this State, means the Division of Mines in the Department of Natural Resources.

2004. "Person" includes any individual, firm, association, corporation, or any other group or combination acting as a unit.

CHAPTER 2. THE DIVISION OF MINES

2200. For the purposes of this chapter "mine" includes all mineral bearing properties of whatever kind or character, whether underground, quarry, pit, well, spring or other source from which any mineral substance is or may be obtained. "Mineral" for the purposes of this chapter includes all mineral products both metallic and nonmetallic, solid, liquid or gaseous, and mineral waters of whatever kind or character.

2201. The State Mineralogist shall employ competent geologists, field assistants, qualified specialists, and office employees when necessary in the execution of the plans and operations of the division under this chapter and shall fix their compensation.

2202. The State Mineralogist shall maintain offices, and a museum, library, and laboratory in San Francisco for the purposes provided in this chapter.

2203. The State Mineralogist shall make a biennial report to the Governor on or before the fifteenth day of September next preceding the regular session of the Legislature.

2204. The State Mineralogist may receive on behalf of this State, for the use and benefit of the division, gifts, bequests, devices, and legacies of real or other property and may use the same in accordance with the wishes of the donors. If no instructions are given by the donors, the State Mineralogist shall manage, use, and dispose of the gifts, bequests, and legacies for the best interests of the division and in such manner as he may deem proper.

2205. The State Mineralogist shall:

(a) Make, facilitate, and encourage special studies of the mineral resources and mineral industries of the State.

(b) Collect statistics concerning the occurrence and production of the economically important minerals and the methods pursued in making their valuable constituents available for commercial use.

(c) Make a collection of typical geological and mineralogical specimens, especially those of economic and commercial importance such collection constituting the museum of the division.

(d) Provide a library of books, reports, and drawings bearing upon the mineral industries, the sciences of mineralogy and geology, and the arts of mining and metallurgy, such library constituting the library of the division.

(e) Make a collection of models, drawings, and descriptions of the mechanical appliances used in mining and metallurgical processes.

(f) Preserve and so maintain such collections and library as to make them available for reference and examination, and open to public inspection at reasonable hours.

(g) Maintain, in effect, a bureau of information concerning the mineral industry of this State to consist of such collections and library, and arrange, classify, catalogue, and index the data therein contained, in a manner to make the information available to those desiring it.

(h) Issue from time to time such bulletins as he may deem advisable concerning the statistics and technology of the mineral industries of this State.

2206. The State Mineralogist may prepare a special collection of ores and minerals of California to be sent to or used at any world's fair or exposition in order to display the mineral wealth of the State.

2207. The owner, lessor, lessee, agent, manager, or other person in charge of any mine of whatever kind or character within the State shall forward to the State Mineralogist, upon his request, at his office, not later than the thirty-first day of March in each year, a detailed report upon forms which will be furnished showing the character of the mine, the number of men employed, the method of working the mine and the general condition thereof, and the total mineral production for the past year. He shall also furnish any additional information relative to such mine that the State Mineralogist may from time to time require for the proper discharge of his official duties. Any such person who fails to comply with the provisions of this section is guilty of a misdemeanor.*

2208. The State Mineralogist or a qualified assistant may at any time enter or examine any and all mines, quarries, wells, mills, reduction works, refining works, and other mineral properties or working plants in this State in order to gather data to comply with the provisions of this chapter.

2209. The State Mineralogist may fix a price upon and dispose of to the public all publications of the division, including reports, bulletins, maps, registers, or other publications. The price shall approximate the cost of publication and distribution. He may also furnish the publications of the division to public libraries without cost and may exchange publications with geological surveys, scientific societies, and other like bodies.

2210. All money received by the division from sales of publications issued by the division shall be deposited at least once each month in the State treasury to the credit of the Division of Mines revolving printing fund, which fund is continued in existence. This fund is appropriated for the use of the division, in addition to such other funds as may be appropriated, for the printing and publishing of reports, bulletins, and maps issued by the division. The State Controller may require financial reports from the division or any officer thereof.

(Added by Stats. 1939, Ch. 96, as part of codification.)

* Sec. 19 of the Penal Code of California provides: "Except in cases where a different punishment is prescribed by this code, every offense declared to be a misdemeanor is punishable by imprisonment in a county jail not exceeding six months, or by a fine not exceeding five hundred dollars, or by both."

PUBLICATIONS OF THE DIVISION OF MINES

During the past sixty-three years, in carrying out the provisions of the organic act creating the former California State Mining Bureau, there have been published many reports, bulletins and maps which go to make up a library of detailed information on the mineral industry of the State, a large part of which could not be duplicated from any other source.

One feature that has added to the popularity of the publications is that many of them have been distributed without cost to the public, and even the more elaborate ones have been sold at a price which barely covers the cost of printing.

Owing to the fact that funds for advancing the work of this department have usually been limited, the reports and bulletins mentioned are printed in limited editions many of which are now entirely exhausted.

Copies of such publications are available for reference, however, in the offices of the Division of Mines, in the Ferry Building, San Francisco; State Building, Los Angeles; State Office Building, Sacramento; Redding; and Division of Oil and Gas at Santa Barbara, Santa Paula, Taft, Bakersfield, Coalinga. They may also be found in many public, private and technical libraries in California and other states and foreign countries.

A catalog of all publications from 1880 to 1917, giving a synopsis of their contents, is issued as Bulletin No. 77.

Publications in stock may be obtained postpaid by addressing the San Francisco, Los Angeles or Sacramento offices and enclosing the requisite amount.

Remittances of stamps in an amount not to exceed 26 cents, currency or coin will be accepted at sender's risk. Payment is preferred in the form of money orders.

Money orders should be made payable to the Division of Mines.

Write for latest revised price list.

NOTE.—The Division of Mines frequently receives requests for some of the early Reports and Bulletins now out of print, and it will be appreciated if parties having such publications and wishing to dispose of them will advise this office.

October, Inyo County, Biennial Report of State Mineralogist, Sulphur Deposits of Inyo County, Geology of the Darwin-Lead Mining District	Price \$0.60, sales tax \$0.02	\$0.62
Chapters of Report XXXV, 1939 (quarterly) titled "California Journal of Mines and Geology," containing the following:		
January, San Diego County, Geology and Oil Possibilities of Southwestern San Diego Co.; Prospect for 'Minor Metals' and Nonmetallic Minerals; The Right to Mine	Price \$0.60, sales tax \$0.02	.62
April, Shasta County, Public's Interest in Mine Taxation	Price \$0.60, sales tax \$0.02	.62
July, Tertiary Formations of Northern Sacramento Valley, California; Geology and Oil Possibilities of Caliente Range, Cuyama Valley and Carrizo Plain, California; Bibliography of the Geology and Mineral Resources of California for the year 1937; the Giant Goose Lake Meteorite from Modoc County, California	Price \$0.60, sales tax \$0.02	.62
**October, Quicksilver Resources of California; Sulphate Minerals of the Leviathan Sulphur Mine, Alpine County, California		----
Reprint of Quicksilver Resources	Price \$0.50, sales tax \$0.02	.52
Chapter of Report XXXVI, 1940 (quarterly) titled "California Journal of Mines and Geology," containing the following:		
January Current Mining Activity in Southern California; Notes on Beryl with a Qualitative Analysis for Beryllium; Strategic Minerals Investigations Procedure followed by the U. S. Bureau of Mines	Price \$0.60, sales tax \$0.02	.62
April, Mineral Resources of Mono County; General Geology and Ores of the Blind Spring Hill Mining District, Mono County, California; Short Report on the Geological Formations Encountered in Driving the Mono Craters Tunnel; Methods and Costs of Mining and Concentrating Chromite	Price \$0.60, sales tax \$0.02	.62
July, Economic Mineral Deposits of the Newberry and Ord Mountains, San Bernardino County; Geology of the Newberry and Ord Mountains, San Bernardino County, California; Notes on the Geology of a Portion of the Calico Mountains, San Bernardino County, California; Study of Chrome Process Aided by Martin Dennis Company	Price \$0.60, sales tax \$0.02	.62
October, Mineral Resources of the Kernville Quadrangle; Strategic Problems of the Mineral Industry in California; Descriptive Geology of the Kernville Quadrangle, California; Biennial Report of the State Mineralogist; Strategic Tax Exemption; Federal Loans for Strategic Minerals	Price \$0.60, sales tax \$0.02	.62
Chapters of Report XXXVII, 1941 (quarterly) titled "California Journal of Mines and Geology," containing the following:		
January, Mineral Resources of Trinity County; Strategic Minerals Procurement; Geologic Investigation of the Chromite Deposits of California; United States Supreme Court Renders Far-reaching Decision on Power Permits on "Navigable" Streams; Securities and Exchange Commission	Price \$0.60, sales tax \$0.02	.62
April, Tungsten Resources of California; Geological Progress of State Division of Mines; California Earthquakes of Mission Period, 1769-1838	Price \$0.60, sales tax \$0.02	.62
July, (Nevada County Report and Maps) Mines and Mineral Resources of Nevada County; Price of Gold	Price \$0.60, sales tax \$0.02	.62
October, (Humboldt County) Mineral Resources of Humboldt County; Recent Developments in the Tungsten Resources of California; Tin in California	Price \$0.60, sales tax \$0.02	.62
Chapters of Report XXXVIII, 1942 (quarterly) titled "California Journal of Mines and Geology," containing the following:		
January, Mines and Mineral Resources of Sierra County; Chromium	Price \$0.60, sales tax \$0.02	.62

REPORTS—Continued

	Price (including postage and sales tax)
Asterisks (**) indicate the publication is out of print.	
April, Mineral Resources of Imperial County (report and map); Geology and Mineral Deposits of the Cargo Muchacho Mountains, Imperial County (map and report); Imperial Carbon Dioxide Gas Field; Legendary "White Metal" and Its "Ore"; Mine Assessment Work Suspended on Claims Within Withdrawn Areas.	
Price \$0.60, sales tax \$0.02	\$0.62
July-October, Tungsten. Tabulated list of deposits; Economic Mineral Map No. 4—Tungsten; Geology of Ghost Canyon Deposit, Madera County; Geology of Welsh Deposit, Madera County; Geology of Confidence Mining District Deposits, Tuolumne County; Contact-Metamorphic Rocks of Twin Lakes Region, Fresno County; Coso Hot Springs Geology; Biennial Report of State Mineralogist.	
Price \$1.20, sales tax \$0.03	1.23
Chapters of Report XXXIX, 1943 (quarterly) titled "California Journal of Mines and Geology" containing the following:	
January, Mines and Mineral Resources of Santa Cruz County (report and map); Organization and Service of the Division of Mines; Recent Activity in the Strategic Minerals in the San Francisco, Los Angeles, Sacramento, and Redding Field Districts; Department of Interior Information Service.	
Price \$0.60, sales tax \$0.02	.62
Subscription, \$2.00 postpaid in advance

Grass Valley and Nevada City District claim map-----	Price \$0.10
Oil and Gas Fields Map, accompanying Bulletin 118, Map separately----	Price \$1.00, sales tax \$0.03 1.03
Chromite deposits -----	Price \$0.60, sales tax \$0.02 .62
Tungsten deposits, sold in conjunction with July-October 1942 Chapter of Report XXXVIII, Map separately-----	Price \$0.60, sales tax \$0.02 .62

OIL AND GAS FIELD MAPS

The following maps are on sale at the State Division of Oil and Gas, Ferry Building, San Francisco, and the various branch offices. The maps are revised as development work advances and ownerships change. Price includes postage.

No.	Price
1—Sargent, Santa Clara County-----	\$0.75
2—Santa Maria, including Cat Canyon—Los Alamos, Santa Barbara County -----	1.25
3—Santa Maria, including Casmalia and Lompoc, Santa Barbara County--	1.25
4—Brea Olinda and East Coyote, Los Angeles, Orange Counties-----	1.25
6—Salt Lake—Beverly Hills, Los Angeles County-----	1.25
7—Sunset, including San Emidio, Kern County-----	1.25
8—South Midway, including Buena Vista Hills, Kern County-----	1.25
9—North Midway and McKittrick, Kern and San Luis Obispo Counties----	1.25
10—South Belridge and McKittrick-Temblor oil fields, Kern County-----	1.25
11—Lost Hills and North Belridge, including Antelope Hills, Kern County--	1.25
12—Devils Den, Kern County-----	1.00
13—Kern River and Kern Front fields, including portion of Poso Creek field, Kern County -----	1.00
14—Coalinga and East Coalinga Extension, Fresno County-----	1.50
15—Elk Hills, Kern County-----	1.25
16—Ventura-Ojai, Ventura County-----	1.25
17—Santa Paula-Ojai, including South Mountain, Ventura County-----	1.25
18—Sepe-Piru-Simi, including Bardsdale, Ventura County-----	1.50
18a—Newhall, Aliso Canyon, Newhall-Potrero, Del Valle and Oak Canyon, Los Angeles County -----	1.25
19—Arroyo Grande, San Luis Obispo County-----	1.00
20—Long Beach, Los Angeles County-----	1.75
21B—District 5, boundaries of areas including oil fields, Fresno, Kings and Kern Counties -----	1.00
21C—District 4, boundaries of areas including oil fields, Kern, Kings and Tulare Counties -----	1.25
22—District 3, boundaries of areas including oil fields, Santa Barbara County	.75
23—District 2, boundaries of areas including oil fields, Ventura County----	1.00
24—District 1, boundaries of areas including oil fields, Los Angeles and Orange Counties -----	1.00
26—Huntington Beach, Orange County-----	1.50
27—Santa Fe Springs, Los Angeles County-----	1.25
28—Torrance, Los Angeles County-----	1.25
28a—Townlot area, Torrance field, Los Angeles County-----	.75
29—Dominguez, Los Angeles County-----	1.00
30—Rosecrans, Los Angeles County-----	1.25
31—Inglewood, Los Angeles County-----	1.25
32—Seal Beach, Los Angeles and Orange Counties-----	1.25
33—Rincon, Ventura County-----	1.50
34—Mt. Poso and Poso Creek, Kern County-----	1.00
35—Round Mountain, Kern County-----	1.00
36—Kettleman North Dome and Middle Dome, Fresno and Kings Counties	1.50
37—Montebello, Los Angeles County-----	1.00
38—Whittier, Los Angeles County-----	1.25

OIL AND GAS FIELD MAPS—Continued

<i>No.</i>	<i>Price</i>
39—West Coyote Oil Field, Los Angeles and Orange Counties-----	\$1.25
40—Elwood, Goleta (abandoned), La Goleta (gas), Santa Barbara County--	1.25
41—Potrero, Los Angeles County-----	1.00
42—Playa del Rey, Los Angeles County-----	1.50
43—Capitan, Santa Barbara County-----	1.09
44—Mesa, Santa Barbara County-----	1.50
46—Richfield, Orange County-----	1.25
48—Mountain View and Edison, Kern County-----	1.25
49—Fruitvale, Kern County-----	1.00
50—Wilmington, Los Angeles County-----	1.25
51—Santa Maria Valley, Santa Barbara County-----	1.00
52—El Segundo and Lawndale, Los Angeles County-----	1.50
53—Rio Bravo and Greeley, Kern County-----	1.00
54—Wasco oil field, Buttonwillow and Semitropic (gas), Kern County-----	1.25
55—Canal, Canfield Ranch, Coles Levee, Strand, Ten Section, Kern County	1.25
56—Paloma, Kern County-----	1.25
57—Rio Vista (gas), Sacramento, Solano, and Contra Costa Counties----	1.00
58—Trico Gas, Kern, Kings and Tulare Counties-----	1.00
59—Raisin City, Helm and Riverdale, including Wheatville area, Fresno County -----	1.25
